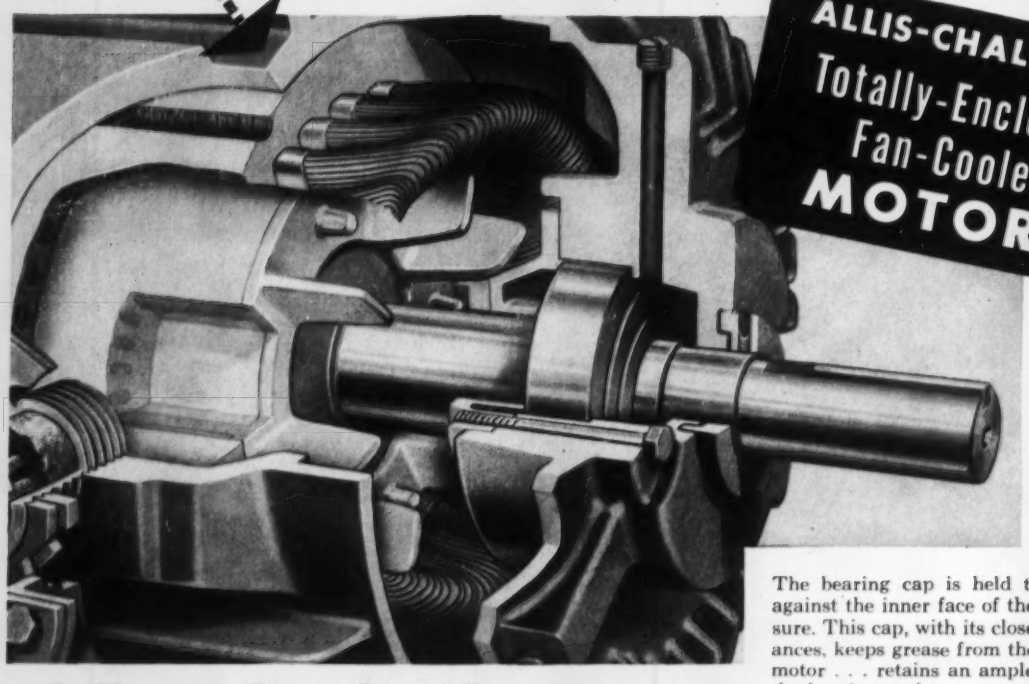
Get Both
bearing features



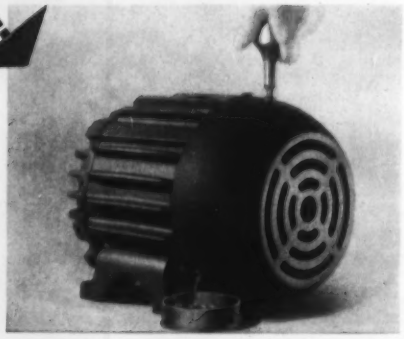
ALLIS-CHALMERS
Totally-Enclosed Fan-Cooled MOTORS

fully enclosed and protected

The bearing cap is held tightly in place against the inner face of the bearing enclosure. This cap, with its close running clearances, keeps grease from the interior of the motor . . . retains an ample supply within the bearing enclosure.

At the outer side of the bearing, double labyrinth seals keep grease in, also keep dirt out. What's more, large grease reservoirs act as additional dirt traps.

. . . yet easy to grease



You can lubricate the bearings without dismantling the motor. Pipe-tapped holes in the bearing housings at three points provide both means for inserting new grease and a means of flushing out old grease.

Look for the extra bolts on the end housing . . . the sign of greater value. Ask your Allis-Chalmers representative or Authorized Distributor to show you a cutaway section of this maintenance-cutting design. Or write Allis-Chalmers, Milwaukee 1, Wisconsin, for Bulletin 51B7225.

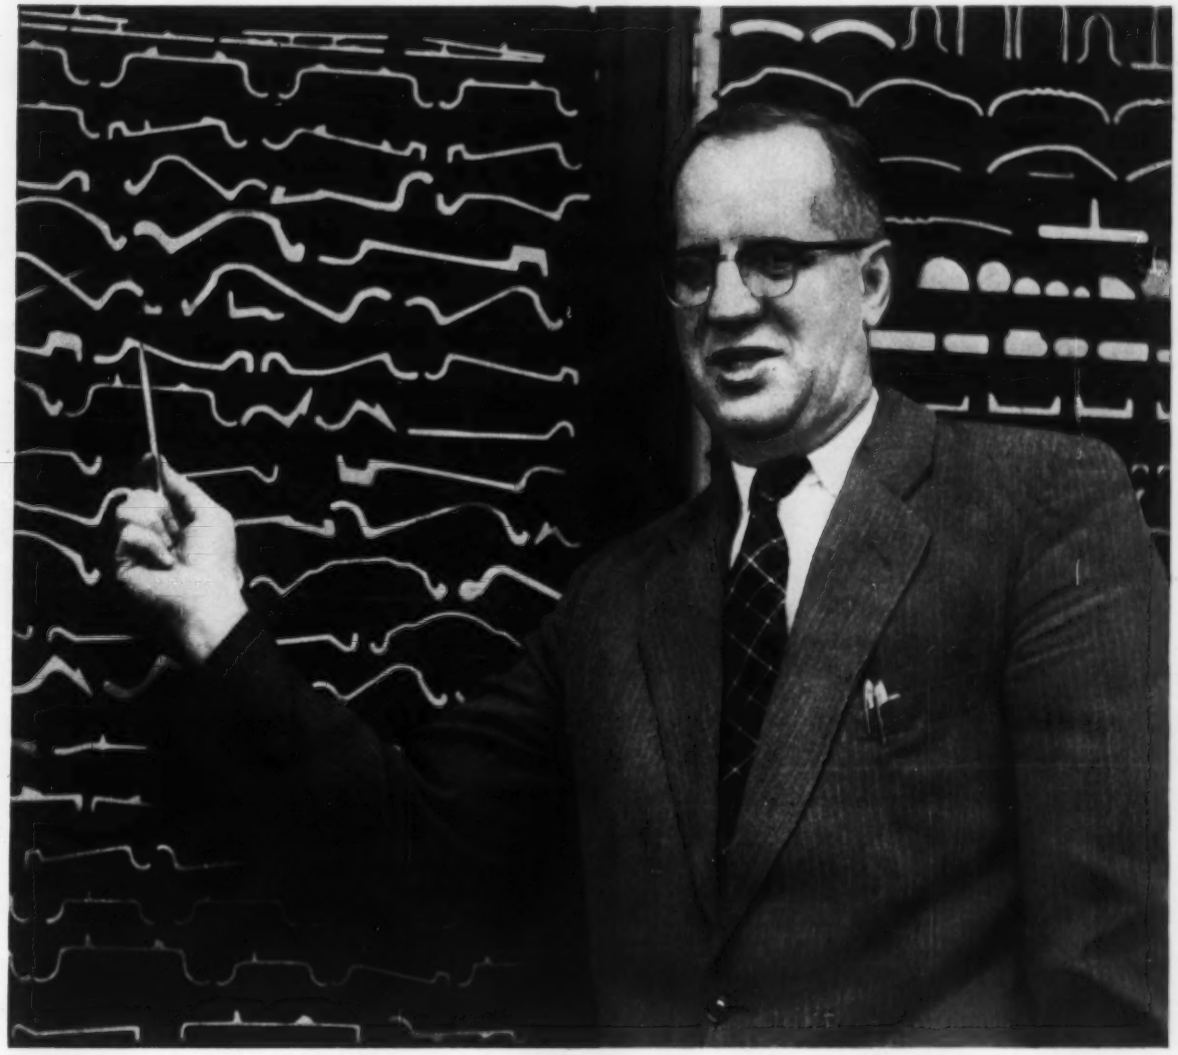
ALLIS-CHALMERS

A-C ALLIS-CHALMERS



Could a special rolled section save money for you?

It wouldn't surprise us a bit if a special section, perhaps similar to one of these, could save you a barrel of money.

Special sections, hot-rolled to your drawings and specifications, have many advantages. They eliminate costly machining, forming and fabricating; they allow you freedom of design. Rolling puts extra metal where you want it for strength; eliminates excess metal for economy.

The display of special sections shown here gives you some idea of the wide range of shapes that are rolled by Bethlehem, helping manufacturers in many lines to reduce their costs.

Automotive tire rims and door hinges, lawn mower cutter bars, steel sash, sled runners and fence posts are a few examples of the varied uses of Bethlehem special sections.

Perhaps we could help you determine how special sections can cut your production costs. We suggest you contact the Bethlehem sales office most convenient to you.

Bethlehem carbon-steel bar products include an unusually broad range of hot-rolled carbon bars in standard and special sections and bar-size shapes. Also semi-finished products, including blooms, billets and slabs.

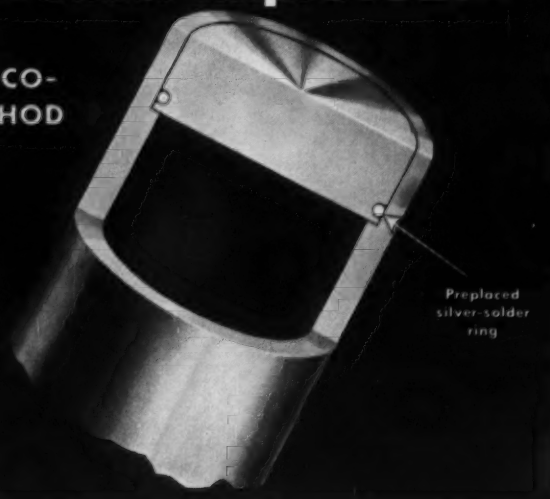
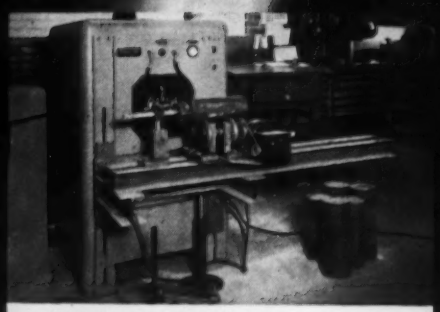
Production Doubled

Costs Cut 50%

Product Improved...





TOCCO heating station with inductor and fixture for silver brazing cylinder and cylinder cap assemblies.

with TOCCO* Induction Heating

The experience of The Commercial Shearing and Stamping Company, who use TOCCO for silver-brazing hydraulic cylinder assemblies, is typical of the benefits obtained by America's leading metal-working plants who use TOCCO Induction Heating for brazing, hardening, heat-treating, forging and melting operations.

More Production with TOCCO

a. Heating time per piece cut from 15.3 minutes to 2 minutes on 5¼" I.D. cylinder.

b. Machining and cleaning operations, formerly required, are not needed after TOCCO brazing.

Lower Costs with TOCCO

a. Through a reduction in time required for each piece.

b. Through the elimination of scrap and reworks.

c. Because, since TOCCO is automatic, operator need not be trained or especially skilled.

Improved Product with TOCCO

a. Because of better looks and sales appeal.

b. Because distortion is minimized.

c. Because of elimination of field failures due to severe stress pockets.

TOCCO Engineers — can probably find applications in your plant, too, where TOCCO Induction Heating can increase output, cut unit costs and improve your product. Such a survey costs you nothing—and may save you a great deal.

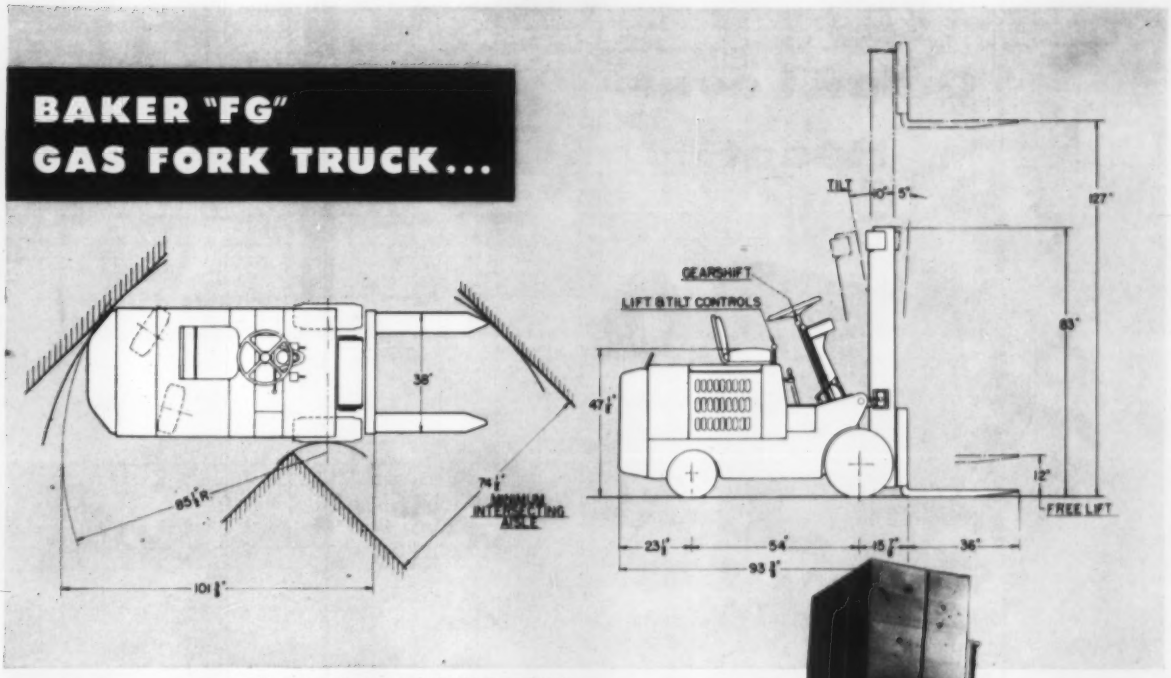
BAKER "FG" GAS FORK TRUCK...



Dimensional Drawing of FG-60, 6000 pound capacity.

why "BALANCED DESIGN" makes it the best!

"Balanced Design" means that every component be engineered to its specific function. Further that all elements be matched and coordinated to work together for top efficiency, maximum dependable service and longest life.

In the "Balanced Design" Baker FG Gas Trucks, for example, you get an integrated power train, consisting of drive axle, transmission and clutch, selected and engineered to be the best possible unit to perform its required function. Features include: compact rigid construction without troublesome universal joints, split clutch housing for easy accessibility, and *single oil supply for entire assembly.*

"Balanced Design" also assures you that the power plant is not merely an automotive engine modified for truck use. It is a heavy-duty industrial engine specially engineered for rugged industrial truck service and built by an outstanding manufacturer. Our specifications call for moving parts to balance much closer than ordinary engine parts: pistons balanced to ± grams instead of ounces, crankshaft to 4 inch-ounces and connecting rods to 2 grams.

These are some of the reasons why Baker "FG" is the only gas fork truck with a full 6 months' warranty, and why we say "BALANCED DESIGN" makes it the best.

Baker "FG" gas fork trucks are available with 3,000, 4,000, 5,000 and 6,000 pound capacities. Specific bulletins can be obtained by writing The Baker-Raulang Co., 1259 West 80th Street, Cleveland 2, Ohio.

Baker
HANDLING EQUIPMENT

8 REASONS WHY THE BAKER FG FORK TRUCK IS FIRST IN ITS CLASS...

1. **LOWER INITIAL COST**—FG-40 (4000 lb.) $4295. Other models at proportionate savings.
2. **LONGER WARRANTY PERIOD**—Baker quality permits full 6 months warranty.
3. **HIGHER LIFT**—Mast design allows higher standard lift than ordinary trucks.
4. **LOWER MAINTENANCE COSTS**—Designed for easier and less frequent servicing.
5. **MORE MANEUVERABLE**—Short turning radius cuts aisle width, adds floor space.
6. **EASIER TO OPERATE**—Greater visibility . . . easy-to-work controls.
7. **GREATER STABILITY**—Lower center of gravity, higher "stability factor" ratio.
8. **BETTER BRAKING**—Full floating, self-equalizing, self-energizing brakes.

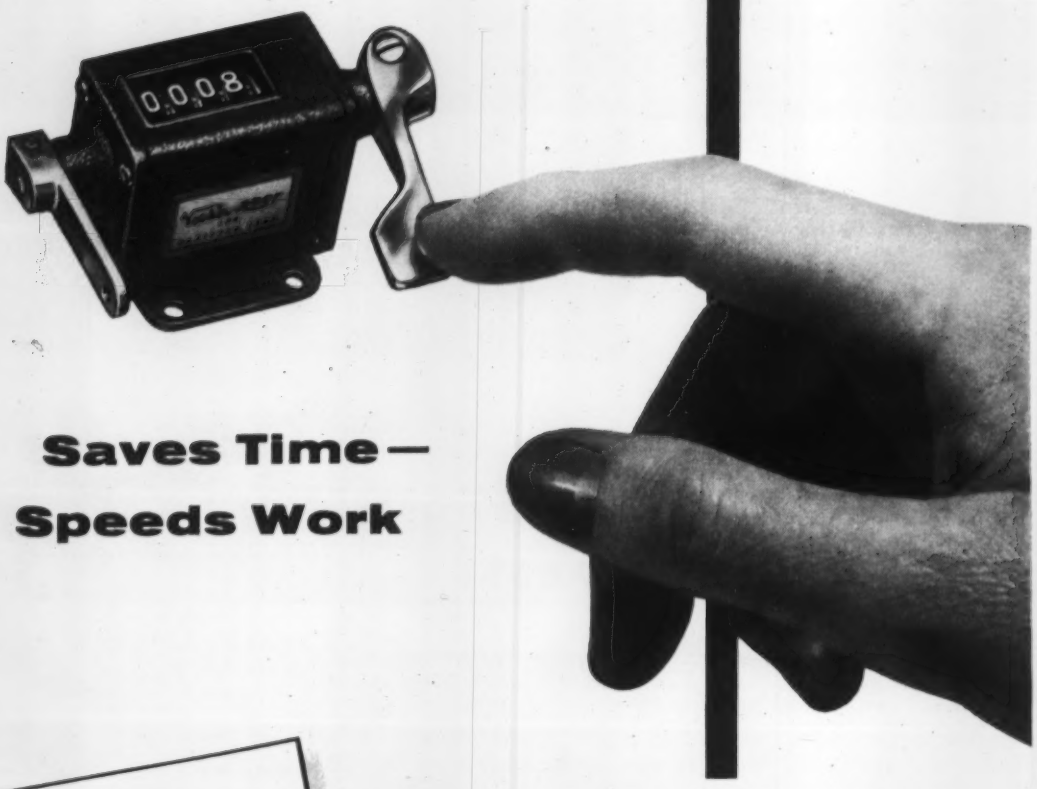
Quick Lever Reset



Saves Time— Speeds Work

Added Evidence that—

Everyone Can Count on VEEDER-ROOT

Where time consumed in resetting is at a premium . . . on short machine-runs, inspection, military equipment and other applications . . . this new time-tested Quick-Reset Ratchet Counter is exactly the time-saving device you need. Just depress the easy-acting lever on the right side through 45° . . . *all 4 figures reset instantly to zeros.* And a thumb-lever may be used on the left side also if the counter is to be operated manually.

This compact, standard counter, now readily available from stock, is one of scores of Veeder-Root Counters (both standard and special) for manual, mechanical and electrical operation in every field from electronics to atomics. Just name what you want to count . . . and "The Name that Counts" will help you do the job. Write:

MEMO TO: P.A.
re: Call Seymour for top quality BRASS
C.E.S.

More and more buyers, designers and production men are learning that Seymour's new, up-to-the-minute production machinery and three quarter century of experience assures them of top quality Brass with . . .

● UNIFORMITY OF GAUGE for the full width and length of the metal.

● MAINTENANCE OF CLOSER TOLERANCES which is made possible by the use of modern, precision rolling equipment.

These pace-setting standards are rapidly raising Seymour-quality Brass to the top of the "Preferred" List for hundreds of executives who specify and buy primary metals.

Equally famous for their exceptional quality are Seymour NICKEL SILVER • PHOSPHOR BRONZE • WELDING ROD • BRIGHT (Plating) NICKEL • NICKEL ANODES

behind the scenes

Chauvinistic Note

Remember the groups that hampered the United States during World War II? They organized under patriotic slogans, affected varicolored shirts, duped gold star mothers, confused public figures and won the enthusiastic support of every reluctant 1-A in the country. They turn up in every war, in every country. During the Spanish Civil War, a general declared: "I will attack with five columns. As the four approach, the fifth will rise within the enemy lines."

Once upon a time, 92 years ago today, a fifth column rose in New York against the Union. We mention it because it fell upon a holiday, a patriotic holiday that deserves some attention, but we hesitate to get stirred up. Apparently it isn't fashionable any more to grow excited over things like that. The business press, in particular, is too practical to emote over a patriotic holiday, too preoccupied with methods and materials to grow starry-eyed over a flag, much too conservative to shoot off firecrackers and shout "hooray!"

Well, back in 1863 so much emotion was stirred up on this date the country practically went nuts. It was the second greatest holiday in our history. In the space of that one day the Confederate States of America were repulsed at Gettysburg. Grant took Vicksburg, Miss., and freed the Mississippi river; and the biggest fifth column this country ever saw erupted in New York and was crushed. It was a day long to be remembered.

That's all. We just thought it would be nice to say something about the date line that STEEL carries this week. It is the Fourth of July.

Michigan Shows Soo

While we're on subjects of Great Significance (captialized, of course), it should be recorded that a short time back employees of the Penton Publishing Co. were treated to a noonday movie that told us all about the Soo locks. As part of the centennial celebration in connection with the opening of the locks at Sault Ste. Marie, Mich., the University of Michigan went into a huddle with itself and produced a film in sound and color. Not knowing what to call it, but remembering that the subject was the locks of Sault Ste. Marie, the University hit on the title, "The Locks of Sault Ste. Marie."

The film is remarkably interesting, and if you belong to a reputable firm or organization, and are curious about ships, you may borrow this movie by writing to the Audio-Visual Education Center, University of Michigan, 4028 Administration Bldg., Ann Arbor, Mich. A nominal charge covers shipping and insurance.

Wanted: Brief Case

Faie A. Hurd, Industrial Distributor Marketing Associates, 400 W. Madison St., Chicago, sends us a copy of his booklet "Phychology in Selling" with the polite expectation that it "may deal in subjects of interest to you professional writers." What a fox you are, Mr. Hurd! We ain't a professional writer, but we couldn't resist the implied compliment . . . so we read the booklet. It's so practical we've decided to study it, and become a professional salesman.

We Give You a Man Who . . .

A great variety of answers arrived concerning Wolfgang's target. Most of them were right, but no two answers were exactly alike when carried beyond three decimal points: Diameter of bulls'-eye, 3.76; width inner ring, 0.67; middle ring, 1.02; outer ring, 1.64.

Sometimes a casual question can serve to start a discussion, bridge a conversational gap or trigger a chain of events culminating in anything from a fist fight to matrimony. So, to rest you from figures for a spell, here's a question to play with: Of whom was it said: "He was a foe without hate, a friend without treachery, a soldier without cruelty, a victim without murmuring"?

Shrdlu

(Metalworking Outlook—Page 29)

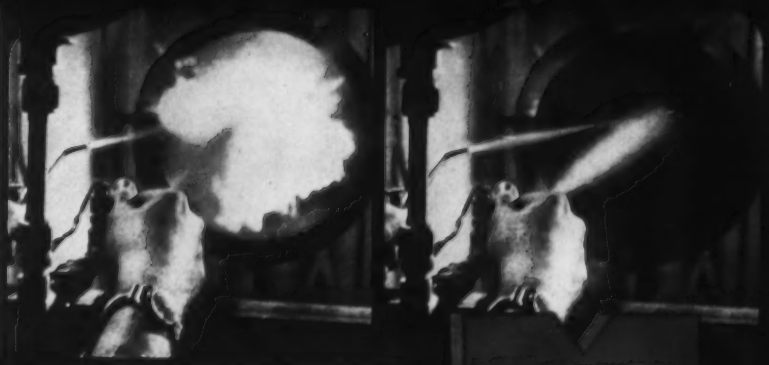
HYDRAULIC DANGER ZONE

Ordinary hydraulic fluid, escaping under pressure, can shoot a fine 40 ft. or more from a broken line! Is your plant safe? Here's how one firm protects men and machines inside the danger zone....

THE SPANG-CHALFANT PLANT of THE NATIONAL SUPPLY CO. switched to fire-resistant Pydraul F-9 hydraulic fluid after a line break involving flammable fluid caused a furnace shutdown, damaged electrical connections and lost 6 hours' production time. The plant operates this Hagan Rotary furnace continuously while a hydraulic boom containing 800 gallons of Pydraul moves white-hot billets in and out of 2250°F. heat. Recently, Pydraul's safety was proved when a ruptured hose sprayed fluid over hot billets and furnace. Result: No damage, no injuries and no time lost! *Pydraul: Reg. U. S. Pat. Off.*

PROOF OF PYDRAUL SAFETY

In photo at left, ordinary hydraulic fluid sprayed into oxyacetylene torch burns explosively. At right, Pydraul does not!



FREE! New 19-page technical booklet, "PYDRAUL F-9," gives facts on Pydraul tests, advantages, properties, uses and installation. Mail coupon to: Organic Chemicals Division, MONSANTO CHEMICAL COMPANY, Box 478-P-5, St. Louis 1, Mo.

SERVING INDUSTRY WHICH SERVES MANKIND

VICKERS® Controlarc

MAGNETIC AMPLIFIER-RECTIFIER

FULL TIME,

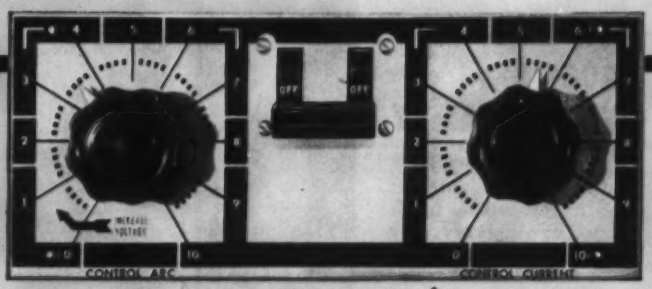
INDIVIDUAL CONTROL
of both current and voltage

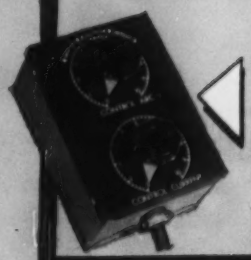
- EASY, CLEAN ARC STRIKES
- HOT STARTS, IMMEDIATE PENETRATION
- NO ARC "POP OUTS"
- NO CURRENT DROP-OFF DURING PASS
- UNIFORM FUSION, STEADY RATE OF METAL DEPOSIT

PATENTED VICKERS MAGNETIC AMPLIFIERS

CONTROLARC automatic control is made possible by the patented Vickers Self-saturating Magnetic Amplifier with exclusive voltage-sensing, feed-back control circuits. Constantly analyzing welding voltage and automatically adjusting welding current to arc changes, Vickers Magnetic Amplifier maintains ideal arc characteristics, through the entire welding range, under all welding conditions.

VOLTAGE and CURRENT INDIVIDUALLY CONTROLLED...





Only Vickers Controlarc offers complete remote control of both voltage and current through the entire welding range. The operator never has to go to the welder to change range switches or taps. Two separate dials individually control voltage and current.

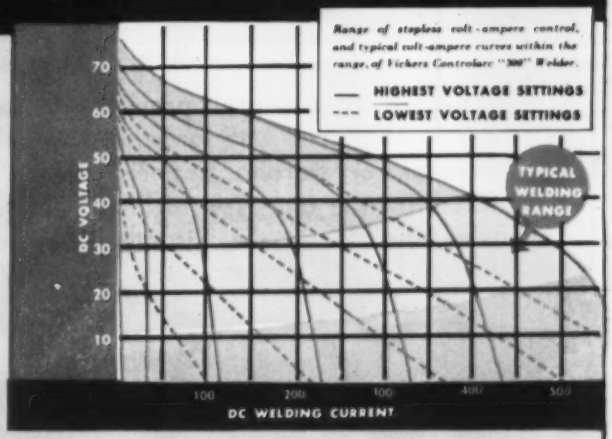
Separate, complete control of both voltage and current makes it possible to set any volt-ampere combination within the output range of the particular Controlarc model being used —from minimum voltage at minimum current to maximum voltage at maximum current.

DC Welder 200 300 400 AMPERE MODELS

AUTOMATIC ARC CONTROL

FULL RANGE VOLTAGE CONTROL

. . . separate from current control, makes it possible to choose the exact arc characteristic for every job and every welding condition. Controlarc full range, stepless voltage control is not limited to a few "average" settings, with blind spots in between. With Controlarc voltage control, the weldor not only can select the arc characteristic for a basic welding position—flat, overhead or vertical—but can pinpoint the setting to his personal preference for the particular condition under which he is welding.



ELECTRICAL SPECIFICATIONS and RATINGS

The Vickers CONTROLARC DC Arc Welder is rated in accordance with NEMA Standards for Rectifier type arc welders.

RATINGS					ELECTRICAL PERFORMANCE				
Rated Amperes at 40 Volts Load, 60% Duty Cycle	Amperes Welding Current Range		Primary Amperes Input per Phase		RATED AMPERES	AT RATED LOAD			
	Minimum at 20 Load Volts	Maximum at 40 Load Volts	230 Volts	460 Volts		PRIMARY KVA	PRIMARY KW	EFFICIENCY %	POWER FACTOR %
200	3	250	42	21	200	16.5	11.6	69	71

LETTERS
TO THE EDITORS

Sell with Color

We are impressed with your article, "Sales Appeal Starts with Finish" (June 13, page 108), and wish to compliment you on it. We would like to obtain 20 reprints for our internal sales organization.

Guy H. Burt
Lloyd Products Co.
Providence, R. I.

I have just finished reading this excellent article. Selecting the right color for a product or package is becoming increasingly important. We could use several copies if available.

E. J. Busch
Manager, Industrial Advertising
Gates Rubber Co. Sales Division Inc.
Denver

No Credit Line

We feel disappointed after reading the article, "Metalworking Aids Road Safety" (June 20, page 64).

We spent much time and effort getting together material on products we make for highway purposes. The paragraph mentioning our company describes only one of our products, and that one is the least in volume. The lighting poles and foundation piling certainly deserved to be covered.

We appreciate use of the photograph showing the overhead sign supports, but why was there no credit line?

A. S. Fromm
Advertising Manager
Union Metal Mfg. Co.
Canton, O.

• *We are well aware of the time and effort spent in preparing the material you submitted, but lack of space prevented us from using more. One of our major problems in editing* STEEL *is finding a spot for all the excellent material available. Omission of the photo credit line was an oversight for which we apologize.*

Tip on Carbide Cutters

In the second article of your 1955 Machining series, "Milling" (May 23, page 100), you mention indexable inserting carbide tip milling cutters. Who produces them?

W. F. Stuker
Purchasing Agent
Taylor Forge & Pipe Works
Chicago

• *The manufacturer is: Detroit Milling Cutter Co., 28625 Grand River, Farmington, Mich.*

Freeing Steel of Oxides

I am interested in the new process for making steel free of included oxides, as mentioned in the item, "Tube Deoxidation," in the Technical Outlook column of June 6 (page 79). Please send

(Please turn to page 12)

NATCO ENGINEERS

OVERCOME DISTORTION

DURING MACHINING

WITH

STRESSPROOF®

SEVERELY COLD-WORKED, FURNACE-TREATED STEEL BARS

The Lead Screw Tapper Spindles of this Natco Three-way Holetapper required machining operations hard to combine without serious distortion.

The front end of each spindle had to be machined as a taper socket for collet application. When the driving keyway and the tool knockout elongated-splined-holes were machined, distortion caused out-of-round taper holes which would not receive the collet correctly.

The rear end of each spindle had to be machined as a driving spline shaft which slides under load. Since the diameter of the spline is relatively small in proportion to the shaft length, any attempt to heat treat caused distortion hard to correct by straightening.

And at the center of each spindle, an accurate lead screw had to be machined by a thread grinding operation. It was found that the finish was much more easily obtained when STRESSPROOF was used.

STRESSPROOF eliminated both the problem of the out-of-round taper holes on the front of each spindle . . and the distortion of the driving-spline-shaft.

STRESSPROOF makes a better part at a lower cost.

National Automatic Tool Co. has for many years used STRESSPROOF in the manufacture of important operating parts for this Three-way Holetapper, as well as for other Natco high-speed machine tools.

MANUFACTURERS OF AMERICA'S MOST COMPLETE LINE OF QUALITY COLD-FINISHED STEEL BARS

Norgren—a complete line of PRESSURE REGULATORS

to Improve Performance, Reduce Wear of Air-Operated Equipment

MORE THAN 1,100,000 NORGREN REGULATORS PUT TO USE BY INDUSTRY

NEARLY 400 STANDARD MODELS

plus many others designed to meet specific performance requirements.

AIR REGULATORS

Reduce line pressures up to 400 psi to maximum delivery pressures of 30, 75, 125 or 250 psi. ⅛" to 1" incl. Series 2A.

RELIEVING-TYPE AIR REGULATORS

Reduce line pressures up to 400 psi to maximum delivery pressures of 30, 75, 125 or 250 psi. Relieving feature protects against unusually high pressures. ⅛" to 1". Series 2AX.

PRECISION AIR REGULATORS, RELIEVING TYPE

Reduce line pressures up to 400 psi to working pressure. Air flow up to 2 cfm with 30 psi maximum delivery pressure. Also flows less than 1 cfm with 60 or 120 psi. ¼". Series 11,400.

PILOT-CONTROLLED AIR REGULATORS, INTEGRAL TYPE

Extreme precision over wide range. Reduce line pressures up to 400 psi to working pressure from 2 to 120 psi. 30, 60, or 120 psi maximum delivery. ½", ¾", 1". Series 20AC.

PILOT-CONTROLLED REGULATORS, REMOTE CONTROL TYPE

Reduce line pressures up to 400 psi to working pressure from 2 to 120 psi. 30, 60 or 120 psi maximum delivery pressure. ½", ½" ¾", 1". Series 20AA.

LOW CAPACITY REGULATORS FOR AIR OR LIQUIDS

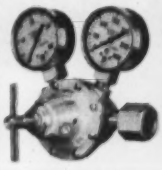
Reduce line pressures up to 400 psi to maximum delivery pressures of 50 or 175 psi. 2 inlet ports, 3 outlet ports. ¼". Series 3A2-B.

LOW PRESSURE AIR REGULATORS

Reduce line pressures up to 250 psi to maximum delivery pressures of 40 or 60 psi. ¼". Series 1505.

LIQUID PRESSURE REGULATORS

For water, oil, non-corrosive liquids up to 200° F. Reduce line pressures up to 400 psi to maximum delivery pressures of 30, 75, 125 or 250 psi. ⅛" to 1" incl. Series 2H.



CYLINDER GAS PRESSURE REGULATORS

Reduce cylinder gas pressures up to 3000 psi to maximum delivery pressures of 50, 75, 175 or 450 psi. 2 inlet ports, 3 outlet ports. ¼". Series 4C and 6C.

BUTANE PRESSURE REGULATORS

For primary stage pressure regulation. Reduce line pressures up to 250 psi to desired working pressure up to 30 psi. ½", ¾", 1". Series 2E.

STEAM PRESSURE REGULATORS

For saturated steam and hot water up to 450° F. Reduce line pressures up to 400 psi to maximum delivery pressures of 50, 75, 125 or 250 psi. ½", ¾", 1". Series 2B.

REGULATOR-FILTER UNIT

Automatically filters air and regulates air pressure. Replaceable, transparent or metal filter bowl. Choice of 3 filter elements. ¼", ⅜". Series 5A and 5N.

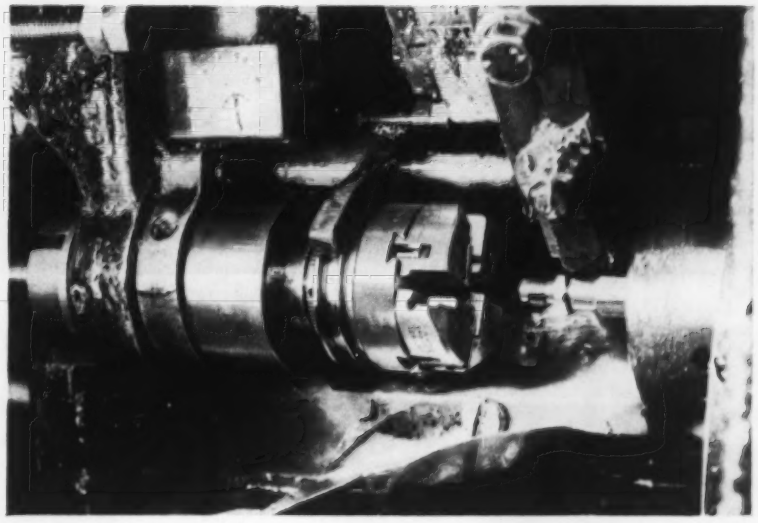
Economy Threading On Limited Clearance Automatics



This equipment displayed at:

To assure economy threading on automatic screw machines where limited die head clearance is a major factor Frank H. Wilson Co., Inc. in Detroit, Michigan use the ½" LL LANDEX Head. Applied to one of their small Acme-Gridley's for threading tubing nuts this head cuts ½", 20 pitch UN threads ⅜" in length on B1113 screw stock to a class three fit. An average of 20,000 pieces are threaded between chaser grinds.

Compactly designed with only a 2⅛" swing the ½" LANDEX will thread all diameters from #4 to ½". A minimum number of working parts made of hardened and ground alloy steel, chaser holders designed to eliminate warpage and springing, and the use of precision LANDIS Tangent Chasers . . . all contribute to the high degree of rigidity and accuracy of this LANDEX Head.

Compare the chaser lengths in the illustrations and note the long life this LANDIS User has received from the chasers used in this application. These chasers will still produce thousands of threads as (1) LANDIS Tangential Chasers are usable for 80% of their original length; (2) only a few thousandths of metal need be removed from a chaser when regrinding; (3) when regrinding the same amount of metal need not be removed from each chaser; (4) long chaser life is received between grinds. These are the basis for economy in any threading operation.

For further information on this LANDEX Head and on other LANDIS Heads using Tangential Chasers and designed for all types of thread-cutting operations write for Bulletins F-80 and F-90. Please send specifications when writing.

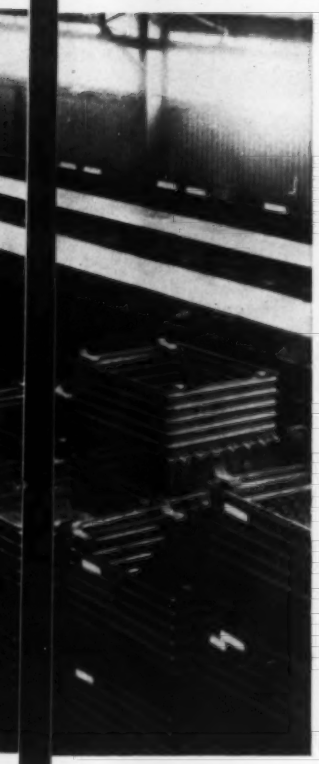
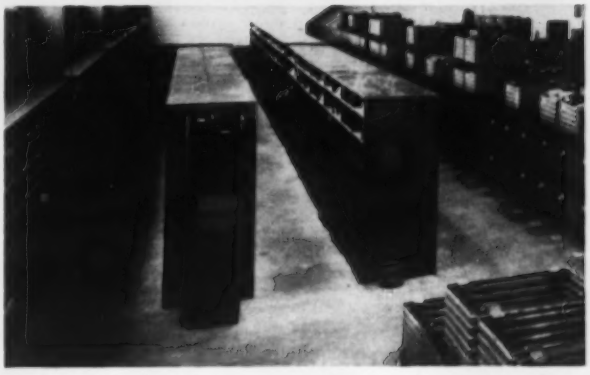
HOW REPUBLIC MATERIALS HANDLING

GOOD HOUSEKEEPING CAN ALSO BUILD GOOD EMPLOYEE RELATIONS. For example, modern steel lockers that conserve space and still provide clean, safe storage for employees' clothing and valuables are made by Republic's Berger Division. Illustrated is the Republic "Space-saver" two-person locker. It provides separate compartments for two people in no more floor area than that required for one large single-tier locker. Berger offers a complete locker planning, engineering and installation service.



PB-120-T BOX AND SKID UNITS used by Chiksan Company are equipped with welded tiering lugs which permit tiering to any practical height. Units are easily lifted and rapidly trucked to any point on the production line or in the warehouse.

WEDGE-LOCK STEEL SHELVING made by Republic's Berger Division assists Chiksan greatly in keeping more accurate records, uses less space and provides easy visible identification of parts. It is specifically designed for high stacking of enormous weights. Completely flexible, it assembles quickly and easily.



housekeeping . . .

EQUIPMENT SAVED SPACE AND REDUCED HANDLING COSTS 25%

The above photos were taken in the Brea, California, plant of the Chiksan Company, makers of ball-bearing swivel joints. They have been using Republic Materials Handling Equipment for about eighteen months for both raw and finished materials.

Here are the results in the words of the Manager of Production and Material Control:

"Our experience is that much less space is required for storage of raw forgings and castings—which allows for better housekeeping and reduces handling costs 25%.

Inventories are much simpler and more accurate. Substantial time saving is realized.

Finished products are stored in both stack-type steel boxes and steel shelving. They assist greatly in keeping more accurate records, use less storage space and provide visible identification. We are able to do a better job with one less employee in the warehouse and to do good housekeeping with less effort.

The installation of these products was a wise and profitable investment."

Chiksan should enjoy future benefits as well. Maintenance costs should be reduced because construction features of all Republic Materials Handling Equipment assure long, efficient service at lowest per-year cost.

The PB-120-T Box and Skid Units illustrated on these pages are only one of many types manufactured by Republic's Pressed Steel Division. There is a wide range of sizes from which to choose. Or if you have a special handling problem, Republic engineers are available to help you design a unit to meet your specific requirements. Your Republic Materials Handling Equipment Dealer has all the facts. Or write us for more information.

REPUBLIC STEEL

World's Widest Range of Standard Steels and Steel Products

and their fuel costs are DOWN...49%

Off to the pokey he goes. The BTU Burglar was caught red-handed stealing billions of BTU's of costly heat. But now that he's been arrested they're saving a cool 49% on fuel.

This forge furnace—which is cited because it's a typical example—had always had heavy firebrick as a lining. But the last time relining was necessary, it was decided to try *lightweight* B&W Insulating Firebrick. Result: Annual fuel cost went down 49%—a saving of $4,800, and this, mind you, was in just one furnace.

Heavy furnace linings waste your fuel dollars two ways: They soak up and hold large quantities of heat which are lost when the furnace is cooled; and they conduct and lose too much heat through the walls. Lightweight insulating firebrick, containing millions of tiny air cells, heat up and cool quickly, absorbing and storing very little heat. Also, they resist heat flow, keeping it inside the furnace to do productive work.

The lighter the brick (and the lightest of all are B&W Insulating Firebrick), the more you save on fuel.

What easier way could there be to cut a major cost? You and those responsible for furnace operations in your plant will find it well worth while to talk it over with the local B&W Refractories Engineer. Or, write to B&W today for further information.

WHAT HAPPENS NEXT?

If management has been wise, a fire tragedy will be stopped before it starts... if not, in 20 minutes extensive destruction and total loss could readily be the result.

First-rate fire protection is essential to the continued success of any business. With C-O-TWO Smoke or Heat Fire Detecting Systems, plus C-O-TWO High Pressure or Low Pressure Carbon Dioxide Type Fire Extinguishing Systems, as well as PYRENE Air Foam Type Fire Extinguishing Systems for specific outdoor locations, your plant can have fast, positive round-the-clock fire watchman service simultaneously at each fire hazard point . . . a fire tragedy is stopped before it starts.

Furthermore, there is a personal sense of responsibility inherent with PYRENE—C-O-TWO Fire Protection Engineers that assures you of fully adequate firesafety . . . a definite plus in your behalf. Whether it's fire detecting or fire extinguishing . . . portables or built-in systems . . . PYRENE—C-O-TWO means top quality backed by experienced engineering that results in operating superiority for you at all times.

Act now . . . don't take unnecessary chances with your investment any longer . . . the extensive experience of PYRENE—C-O-TWO over the years is at your disposal without obligation. Remember . . . a plant-wide fire protection survey skillfully executed today could be the means for greater profits tomorrow.

Today's new lightweight portable grinders need this kind of wheel!

The new lightweight

U. S. ROYALITE

HARD SHELL CUP WHEEL

"X-ray" view of wheel shows pronged anchor bushing and safety ring.

Here a worker uses a lightweight grinder with a U. S. Royalite Hard Shell Cup Wheel, to remove weld butt and to clean up welded structural steel member.

Removing weld flash from fabricated steel component for atomic reactor. Careful dressing of weld flash was required to obtain smooth surface for joining with other components.

Contour grinding (to template) for smooth surface joint between components for atomic reactor. Component is of fabricated steel.

This great wheel is powerfully reinforced by a pronged anchor bushing and safety ring assuring a safer and smoother-running cup.

The U. S. Royalite® Wheel is "job-geared" for these modern lightweight portable grinders. Royalite's free cutting face has a tougher rim, which keeps the edge sharp for the full life of the wheel.

EXTRA DIVIDEND: Remember that when you buy wheels from a United States Rubber Company salesman you are dealing *direct* and are being served by a specialist—a man whose only job is selling and *servicing* abrasive wheels. He will see that you get maximum value out of your abrasive wheel dollars.

• • •

The combination of the *lightweight* grinder and the *safer*, smooth-running U. S. Royalite Wheel means a better job in less time—with less worker fatigue.

"U. S." Research perfects it..."U. S." Production builds it...U. S. Industry depends on it.

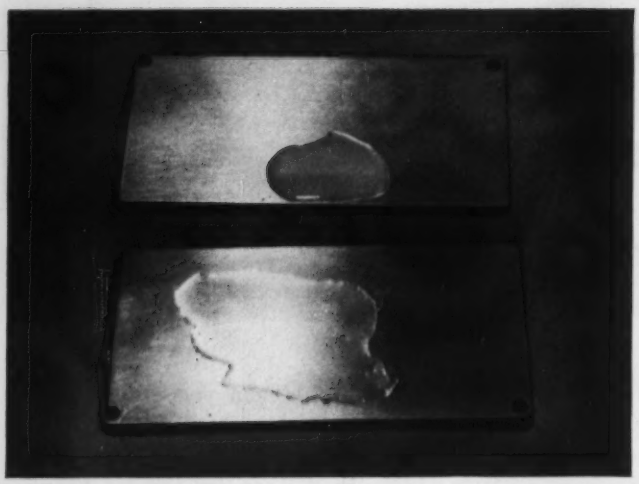
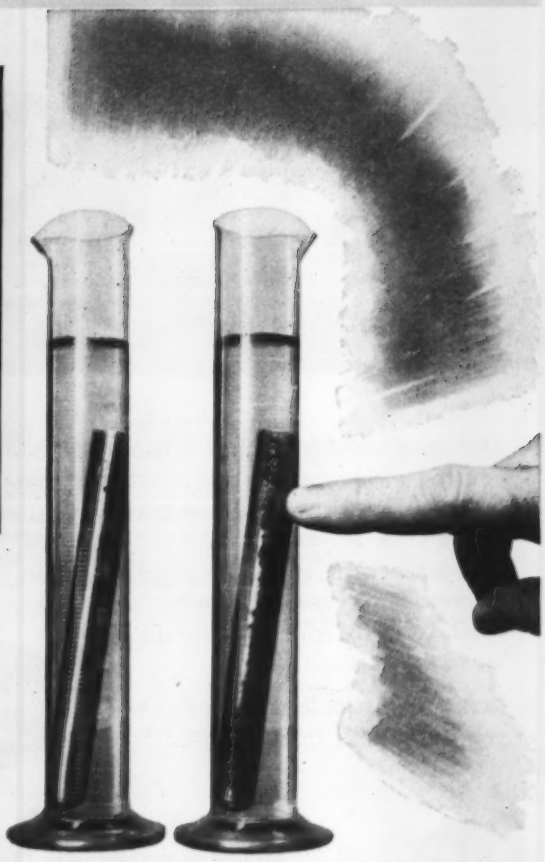
Announcing
SHELL
DROMUS OIL E





Above: Cooling action of a cutting fluid is directly related to its wetting ability. Conventional soluble oil emulsion (background) "balls" up. Equal amount of Shell Dromus Oil E spreads out thinly . . . wets far greater area.

Right: Plain carbon steel, if left in water at room temperature for about two hours, will rust as shown. Sample on left was in a 1-30 solution of Shell Dromus Oil E and water *for six months without rusting.*

SHELL DROMUS OIL E

NEW CUTTING OIL

permits higher speeds and faster feeds than ever maintained before

Shell Dromus Oil E, a new solution-type fluid, wets all metal surfaces with extreme rapidity and keeps both work and tools exceptionally cool. These qualities permit an increase of machine speeds and/or feeds far beyond anything allowable with conventional soluble oils.

IT'S MUCH EASIER ON TOOLS

There's much more life in any cutter or abrasive wheel when protected by this new oil. *It stays put* between tool and work. (At a 1-30 dilution, average tool life increase in extended field tests was about 50%.)

IT FIGHTS RUST

Shell Dromus Oil E is readily soluble in hot, cold, soft or hard water, and stable in any concentration. Even at low concentrations, it gives excellent rust protection to all ferrous metals, *including cast iron.*

IT KEEPS WORK COOL

Even at stepped-up production rates, you'll find less heating and better finish wherever this new oil is used.

IT SETTLES OUT FAST

Chips and wheel particles settle out immediately . . . the recirculated fluid is clean and free from contaminating particles. It is *not* sticky or greasy . . . leaves no deposits on machines or work.

IT'S GREAT FOR GRINDING

Grinding wheels remain clean, *even when material retains a film of cutting oil from a previous operation.* Even cast iron can be ground cleanly when Shell Dromus Oil E is used to cool the work.

If all this reads "too good to be true," we suggest that you try Shell Dromus Oil E *on any problem operation you have.* It *is* that good!

For heavy, continuous service in steel storage yards

The 40-ton, 75-foot span, heavy duty crane shown above is typical of many similar NORTHERN CRANE installations in steel mills, fabricating plants, and similar plants in heavy industry.

NORTHERN mill type cranes are designed and built to meet the most exacting requirements, providing for continuous service, maximum loads, and high impact allowances. Mill type motors and control equipment provide highest electrical performance.

NORTHERN CRANES are the result of over 55 years' experience in the design of overhead electric traveling cranes, heavy duty electric hoists and other materials handling equipment.

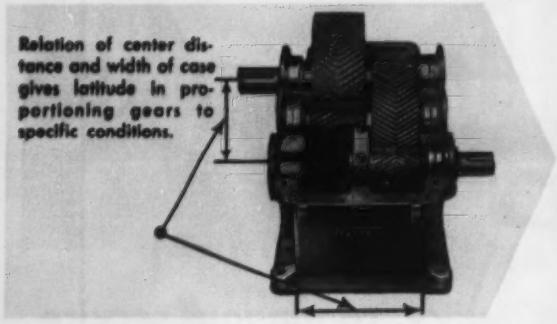
Let us send you our latest bulletins

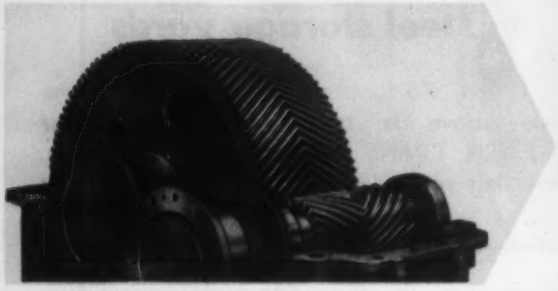
NORTHERN MATERIALS HANDLING EQUIPMENT

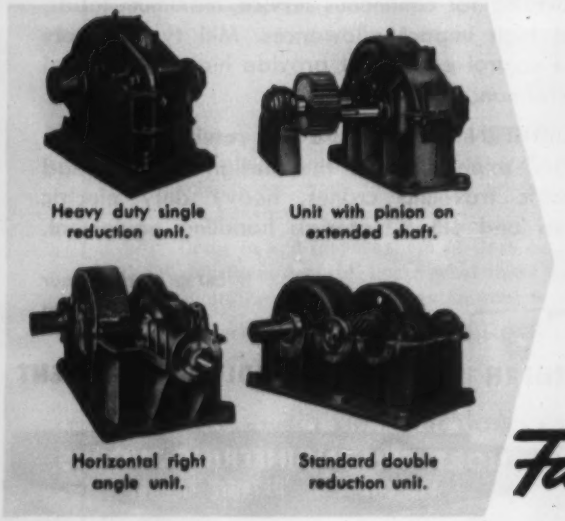
NORTHERN ENGINEERING WORKS
210 CHENE ST., DETROIT 7, MICH.

3 BIG REASONS

WHY IT PAYS TO SEE FARREL® WITH YOUR SPEED REDUCTION PROBLEM







Heavy duty single reduction unit.
Unit with pinion on extended shaft.
Horizontal right angle unit.
Standard double reduction unit.

1 DESIGN FLEXIBILITY

You can ask for—and get—a Farrel speed reducing unit that will fit your requirements exactly. Gears and pinions can be proportioned to meet specific load, speed and service requirements. Input and output shafts can be varied in size, in material and in extension. Housing dimensions can even be changed to meet problems in mounting.

2 PRECISION GEARS

Precision generation by the famous Farrel-Sykes method assures accuracy of tooth spacing, tooth contour and helix angle, which pay off in smooth, quiet, uniform power flow. The herringbone design provides evenly distributed pressure over each tooth, from tip to working depth line. This reduces wear and maintains correct tooth action throughout a long gear life.

3 WIDE RANGE OF RATIOS AND CAPACITIES

Designs include single, double and multiple reduction units, speed-change units having two or more selective speeds, and drives to meet special requirements. Ratios of single reduction units range from 1½:1 to 10:1. Double reduction units are available in a ratio range from 10:1 to 60:1.

For more about these adaptable units write for Bulletin 449.

LEON SWIRBUL

Portrait by Fabian Bachrach

"...over 10,000 employees joined the Payroll Savings Plan..."

"At Grumman, we are proud that in our person-to-person campaign over 10,000 employees joined the Payroll Savings Plan and grasped the opportunity to buy U. S. Savings Bonds regularly every payday. These results were achieved through enthusiastic, patriotic teamwork. I urge every American company to reactivate their Bond Program now in a nationwide effort to maintain sound money and a stable economy."

LEON SWIRBUL, ***President, Grumman Aircraft Engineering Company***

If you have a hundred or more men and women, you can make a substantial contribution to sound money and a stable economy, and also help your employees to build personal security, by installing the Payroll Savings Plan, or reactivating an existing one.

A phone call, wire or letter to Savings Bonds Division, U. S. Treasury Department, Washington, D. C., will bring prompt response from your State Director, who will help you to organize a person-to-person canvass that will put a Payroll Savings Application in the hands of every employee. That's all you have to do. Your employees will *grasp* "the opportunity to buy U. S. Savings Bonds regularly every payday."

The United States Government does not pay for this advertising. The Treasury Department thanks, for their patriotic donation, the Advertising Council and

STEEL
The Metalworking Weekly

...ON JET RINGS

By switching to flash butt-welding of extruded sections, we helped one customer cut fabricating costs of a jet engine ring from $67.85 to $41.93. A saving of $25.92 per ring — roughly 40%.

This is one of many cases in our files where rolling and flash butt-welding of bars, sections, extrusions or plate has proven to be the most economical and practical method of fabricating circular components. Shown below are some other "American Welded" components.

If you require a similar part, it is very likely that this type of fabricating can cut your costs. Why not write our Product Development Division today? They will be glad to study your problem.

Metalworking Outlook

Aircraft Output Slips

The aircraft industry expects to turn out about 12,000 planes this year, 8500 of which will be military. Last year it produced nearly 13,000 aircraft, 9600 of which were military. The output in 1953 was 15,000 units, 11,000 being military. Aircraft Industries Association's Adm. Dewitt C. Ramsey predicts: "Production will continue to decline toward maintenance levels. Our employment has dropped below 800,000, second to the automotive industry." Preliminary returns to an AIA questionnaire indicate: Major producers are placing almost half their contract dollars with other manufacturers. Of the money spent with outside firms, about half goes to firms employing 500 or less.

Coming: More AF Tool Orders

Watch for the Air Force to award by September contracts totaling about $50 million for long lead time machine tools. An additional $23 million in contracts will be let by the end of the year. Late last month the Air Force awarded the first three contracts, for $11 million, in the total $84-million procurement. Requests for bids have been sent out to manufacturers for more than 80 per cent of the program.

Navy To Re-Equip

In fiscal 1957 the Bureau of Ships plans to start a five-year program of equipment replacement at 11 naval shipyards and one repair facility. It has a new formula to determine replacement, based on the assumption that operations will be on a 2½-shift basis under mobilization conditions. Most Bureau of Ships equipment is 11 to 15 years old.

Defense Buying Agency?

The Hoover Commission wants the Defense department to have a Defense Supply & Service Administration to handle procurement and distribution of common items and services for the three military departments. Needed would be an act of Congress to create the new agency. Five members of the commission, four of whom are members of Congress, either dissent from the proposal or reserve the right to change their minds.

Steel Product Mix Changes

A Bethlehem Steel Co. report indicates how dramatically the whole steel industry has changed its product mix in only ten years. The emphasis has shifted to more and more sheet strip production (Bethlehem's capacity is up 187 per cent) and tin and black plate output (its potential increased 106 per cent). The capacity to produce rails and rail accessories has declined. Bethlehem has spent $1 billion since 1946 to boost its capacity for finished prod-

ucts by 55 per cent. It has requests pending for fast tax amortization on additional projects to cost $108.2 million (page 35).

AEC Power Ruling Due

Look for the Atomic Energy Commission to act soon on proposals by four groups of companies to build atomic power reactors with federal aid. The groups are: Consumers Public Power District, Columbus, Nebr.; Yankee Atomic Electric Power Co., Boston; Nuclear Power Group, Chicago; and companies in the Detroit area headed by Detroit Edison Co. The groups have offered to put up some 90 per cent of the cost—$150 million—if the government will supply the balance. Reactors planned would provide 455,000 kw of capacity.

Atom Power by 1980

Sylvania Electric Products Inc. predicts that 25 years from now more than half the power plants then building will be nuclear powered. By 1980, the company says, 17 per cent of the generating capacity will be nuclear powered, representing a probable investment of $14 billion. By 1975, the value of atomic fuel production and related activities will exceed $500 million a year. Sylvania believes that atomic fuel producers will be to the atomic power industry of the future what the coal and oil producers are to utilities today.

Electronics Eclipses Records

Sylvania calls electronics a $9-billion industry, counting television, radio, commercial and military electronics, broadcasting and related segments. It predicts its sales will climb to $15 billion within four or five years and to $20 billion by 1965. Currently producing at a $16-billion annual rate, the combined electrical-electronics industry would be in the $30-billion category by 1965.

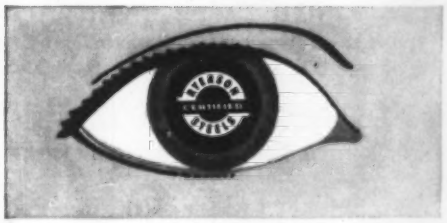
More Area Development

Political and business leaders are stepping up efforts to broaden the industrial scope of their areas. Westinghouse Electric Corp.'s president, Gwilym A. Price, will be chairman of a new Regional Industrial Development Corp. to develop, expand and diversify industry in and around Pittsburgh. West Virginia's governor, William C. Marland, is on a coast-to-coast personal selling tour, aimed at attracting new industry to his state.

Straws in the Wind

The present Defense Production Act has been extended until July 31 to allow Congress more time to consider the two-year extension . . . The Atomic Energy Commission has issued a proposed regulation setting up procedures for issuing licenses to private operators of production and utilization facilities . . . United Auto Worker and United Electrical worker locals have ratified the Ford and GM pacts negotiated by the CIO unions.

Let's take a



new look at quality control

One of the great ideas in steel supply has been taking on new meaning at Ryerson lately—and it will be worth your while to learn about it.

Twenty years ago, the Ryerson plan for Certified Steel was big news because it set standards of quality unequalled in steel from stock at that time. But during the postwar period of great demand, emphasis on quality necessarily gave way a little to emphasis on quantity until additional capacity could be built.

Today, however, there's no compromise! A committee of top Ryerson executives has instituted a sweeping new program of checks and counter-checks. Specifications have been rewritten; inspection techniques tightened; so that today *Certified Steel* means more than ever before. For example, it means that:

— every kind of steel in Ryerson stocks—carbon steel, alloy steel and stainless—is produced to definite specifications for high uniform quality.

— you are protected against the possibility of mixed steels by our spark testing of carbon steel plates and special quality bars, structurals, alloys and stainless bars and plates.

— the specific heat analysis is available for all Ryerson plate steel, special quality carbon bar steel, alloy steel and stainless steel because all are identified by heat number and every heat analysis is kept on file.

— you can use Ryerson alloy steel with complete confidence because a practical 8-step quality-control plan assures dependable performance and guides heat treatment.

— on *all* Ryerson Certified Steels we are able to furnish a certificate of analysis.

Certified Steel means all these things and many more. Its essence is a devotion to quality that has an increasing dollars-and-cents importance to you. The world's largest steel stocks are also the world's finest—backed by over a century of reliability in product and service. Today, more than ever before, you can depend on Ryerson as your best source for the steel you need, when you need it.

RYERSON STEEL

In stock: Carbon, alloy and stainless steel . . . bars, structurals, plates, sheets, tubing, reinforcing bars, machinery & tools, etc.

How a condenser maker wants *his* DSC STRIP and gets it . . . . . as you can, too

***His* specifications**
THICKNESS: .0105″ ± .0005″
(closer-than-standard by 50%)
TEMPER and FINISH: Dead Soft with just enough skin pass to produce a light, satiny surface

•

Each of these "specs" is important in itself. But it's the way they work in combination that makes the job. Here's why·

The strip is rolled 20¼ ″ wide and slit into various widths. It is fed automatically through close-fitting progressive dies of intricate design. Press speed is close to 300 strokes a minute. You can see how even slight variations in thickness and/or temper might cause the strip to jam-up, risking serious damage to expensive tools besides disrupting production. Undue gauge variation might also cause dimensional build-up and hamper the tight assembly operations.

Surface quality is extremely important . . . not "for looks" but for function. In this case, the success of an ingenious hydrogen copper brazing process depends on it.

DSC Strip is giving this customer what he wants. How about trying some yourself? We'll welcome the chance to work with you, too.

Customer Satisfaction Is Our No. 1 Job

This Changing Industry

This week, 31 metalworking companies will go out of business. But 50 new plants will start operations.

New products will be introduced by 125 plants, and 150 companies will change name, ownership or address.

And 850 metalworking executives will move into new positions and functions.

The figures, of course, are averages. They represent what has been happening at a fairly constant rate over the last two years.

Metalworking companies are like people. One dies, two are born, others keep growing up. That's because companies are people.

Constant change is as old as industry itself. Yet the reminder is always surprising.

At a metalworking convention a few weeks ago, we were talking to a retired executive. He had been a moving influence in the association for many years. In 1950, he sold his interest in his company and ceased to attend association meetings. This year he returned, just to see some of his old friends. New blood was running the association. Faces were not familiar. Old friends were missing. Our retired executive was as forlorn as the old grad who after 30 years returns to a college homecoming.

Another friend, a salesman for industrial rubber products, called on a major refrigerator maker for several years. He finally convinced its buyer that his line was just what the company needed. Two months later the buyer moved up, and our salesman had to start all over again.

Such change can be annoying. But it represents a constant challenge and opportunity that thrills the ambitious young businessman.

No product ever is firmly established in its market. There always is the opportunity for a better product to replace it.

No account ever is completely sold. A rival always has the chance to get it.

No person ever is stuck in his job. There always are openings calling for men of competence.

Thank heavens, we are a part of this changing industry.

Walter J. Campbell

An influx of requests for fast tax write-offs means . . .

Steelmen Set To Boost Capacity

THE STEEL INDUSTRY has charted at least another billion dollars worth of improvements and expansions.

This is indicated by applications filed with the Office of Defense Mobilization, Washington, for accelerated tax amortization.

Speed-Up—In the last month, filing has speeded up. The stimulant has been the near-capacity rate of steel production.

Applications have been filed even though the government can take no action on them now. Action must await a government steel expansion goal—based on mobilization needs as determined by ODM. The last goal was attained some time ago.

Getting Set — Steel companies want to be in line for consideration if a new goal is set. Since Jan. 1, steel producers have filed some 70 applications. One-third of them came in June. Value of the 70 projects (11 companies are involved) is $1,064,810,786 (see table).

Nearly all the proposed projects are for steelworks and rolling mills. A few involve blast furnaces and closely related facilities and iron ore and bituminous coal supplies.

Expansion Needed — ODM is studying the need for another round of expansion. It is assisted by a report from the Business & Defense Services Administration of the Department of Commerce. That report is said to make no recommendations on expansion (see STEEL, June 20, p. 54). It cites the small cushion of idle capacity now available.

Purpose of a fast amortization program is to expand private industry's productive capacity to meet mobilization goals. Unlike the World War II period, government ownership of defense facilities during the present "cold war" is being held to a minimum. Accelerated amortization does not involve investment of government funds. It merely designates what private industry projects are eligible for fast depreciation, allowing companies to recover their investments quickly. Under normal depreciation, companies were reluctant to make investments. It took them a long while to get their money back. When they did recover their investments, they found their inflation-weakened dollars would not replace the plants.

The Record — In the round of steel expansion during the Korean war, the government allowed fast amortization on 85 per cent of the cost of a blast furnace and closely related facilities; 65 per cent of the cost of a steel melting furnace and closely related facilities and semifinishing mills; and 50 per cent of the cost of a finishing mill.

What ODM has to do now is determine whether the nation's steel capacity would be sufficient for mobilization.

Pro, Con — You can find two schools of thought in Washington. One points out steel capacity is at an all-time high (ingot capacity is 125.8 million net tons) and says it is sufficient for mobilization

needs. Also cited is the Air Force's belief that any war would be short lived because of atomic and hydrogen weapons.

Other observers point out that ODM and Congress think any war would not be a quickie. The national stockpile of strategic materials is one evidence of preparation for a lengthy mobilization.

Politics? — Although any ODM goal is to be based on mobilization needs, what determines them? Could political and economic considerations influence a decision? A steel expansion program would put a lot of money in circulation; it would help keep business good; it would help pour federal income taxes into the treasury. Conceivably, a strong economy would aid mobilization, might even deter an aggressor. And next year is an election year. The "ins" wouldn't mind if business stays good.

The billion dollars' worth of projects filed with ODM could not be completed until 1959 or 1960 even if work were started immediately. How many would be dropped if ODM doesn't open a steel expansion goal can't be determined now. Undoubtedly some of them would go ahead if steel business remains strong.

Forecasts—Steel executives have been forecasting further expansions. A month ago, Arthur B. Homer, president, Bethlehem Steel Co., predicted that in the next 15 years the steel industry's ingot capacity would be increased 60 million tons.

The steel industry, according to American Iron & Steel Institute, expects to spent $695 million for improvements and expansions this year.

At Last, Steel Marking

A military standard for marking steel is now official. It was approved June 23 by the Defense department and is known as Military Standard 183.

It will be used by the Army, Navy and Air Force and perhaps the Atomic Energy Commission.

Marking will be used only where critical needs exist or where steel is to go into inventory. Covered are bars, extruded shapes and shaped tubing, plates, sheets and strip and tubular products.

How To Be 75 Per Cent Safer

Reducing accidents takes a planned program, says Atlantic Steel Co. You have to sell employees on safety techniques and equipment—not demand that they use them

ADVERTISING and promotion can sell safety programs to employees. Management at Atlantic Steel Co. has reduced accidents 75 per cent through an employee campaign designed to guide and advise rather than force safety as a "must."

Mission Completed—C. J. Vandeventer, safety director, remarks: "When our employees began to ask for respirators and other safety equipment, we knew our program had arrived. It is an employees' program now.

The accident prevention committee at Atlantic consists of supervisors, foremen and union representatives. All share responsibility for the safety of the firm's 2000 employees. Safety meetings are held weekly in all departments. Skits are often used to drive home the safety message.

Reminders—Signs and displays are seen throughout the plant. Result: Employees begin to consider safety and also are appreciative of the concern the company shows for their comfort and welfare.

More Reports for SEC

A mid-year financial report (in addition to an annual report) is now required by the Securities & Exchange Commission from hundreds of business firms. Companies affected are those with securities listed on stock exchanges and those which have registered securities for public sale.

Aim of the new Form 9-K report (see STEEL, May 16, p. 70) is to provide the investing public with more current information. The report is due 45 days after the end of the first half of the fiscal year, starting June 30, 1955.

The mid-year reports are to contain information about sales and gross revenues, net income before and after taxes, extraordinary and special items and charges and credits to earned surplus. The reports need not be certified.

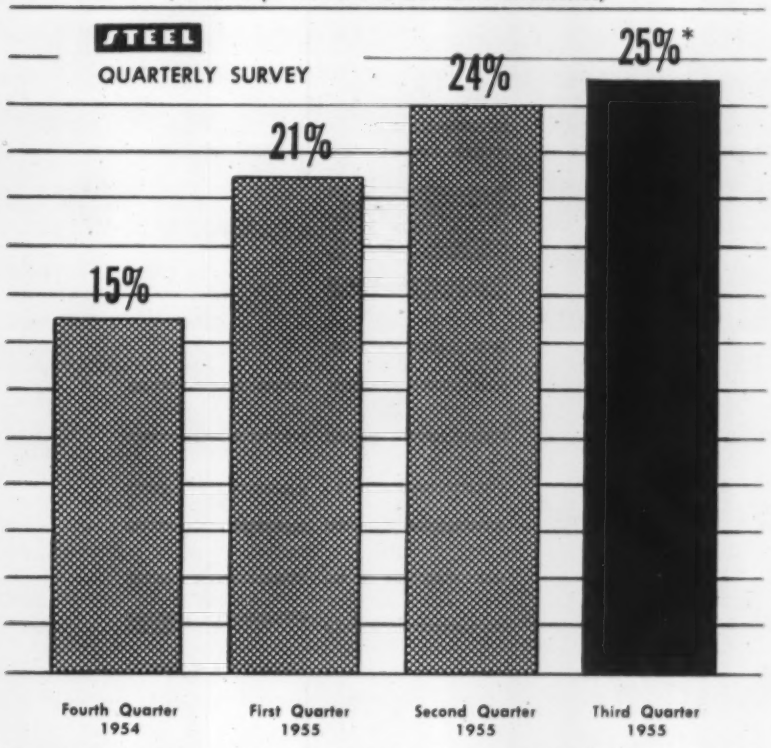
Major Industrial Components

(% of respondents who added to inventories)



Survey includes: Bearings, castings, hose couplings, cylinders, electrical equipment, fasteners, forgings, gears, mechanical rubber goods, screw machine products, springs and wire shapes, stampings, weldments.

*Respondents' estimates

Strong Buying Through Summer

LOOK FOR this in third-quarter buying of industrial components: Purchasing at about the second-quarter rate; deliveries generally good, if extended lead times are taken into account; higher prices.

That's the consensus of metalworking executives reached by STEEL's latest quarterly survey.

Continuation — The inventory building that began late last year is continuing. Buying plans for third quarter indicate that any summer dip will be moderate.

For one thing, the number of firms planning to increase inventories continues to grow (see chart). Of those, 71 per cent say it will put them in a better business position. Only 7 per cent think they'll be worse off.

Frustration — Companies planning to reduce inventories also are more numerous this quarter, but are pretty well balanced off by those whose stocks are still growing. In some cases, inventory reductions are involuntary; the PAs say they'd like to build up stocks but can't because of tight deliveries. In other cases, seasonal factors come into play.

But basically, the picture is one of optimism. In the latest survey, 36 per cent of respondents say they'll be better off, inventorywise, at the end of the quarter than they are now. In the last quarter, 33 per cent thought that way.

Elongation—All told, 4 per cent think they'll be worse off. It's double the number of a quarter ago, but inability to get deliveries on needed components is partly responsible.

Delivery times lengthened during the last quarter, but, in general, slightly higher inventories compensated for the longer lead time. "Steel is the only material giving difficulties at this time," is how a number of PAs size up the situation.

Inclination—Over-all, 88 per cent of the PAs say deliveries are adequate. That's about the same as a quarter ago. At the first of the year, though, 98 per cent said deliveries were OK.

Pointing up a tighter delivery situation is the number of replies putting one or more components on the hard-to-get list. Almost 70 per cent say they are having trouble with at least one item. Last quarter, less than half had complaints. The result is even more customer pressure for quick delivery, several PAs note.

Aggravation—PAs see little easing over the summer. Vacations are one factor that will aggravate the situation. For the first time in almost two years, some report they're pinched because of strikes.

Longer delivery times are having their effect on buying policies and inventories. "We must schedule farther ahead," says one PA. Another outcome is this comment: "We feel lead times are too long, and we must guess too far ahead as to requirements and keep too big a protective inventory."

Prognostication — Prices also were a factor in last quarter's inventory growth. As one PA put it: "We have been building our inventories gradually over the last 90 days anticipating higher prices in the third quarter."

Castings still are the main trouble spots as far as deliveries are concerned, mostly because of long lead times. "Casting orders are not delivered complete or on time," summarizes one western executive.

Qualification—But deliveries do seem a little improved since a quarter ago. Then, one-third of the users of steel castings reported delivery troubles. This quarter, only half that number do. Malleable castings showed a smaller improvement, but more users of gray iron reported difficulties.

Antifriction bearings got tighter in spite of generally higher inventories. On the other hand, lower inventories of gears gave rise to almost double the complaints of a quarter ago.

General Electric Co.

An expanding national economy provides the link as . . .

Power Chain Sales Gain

THE POWER TRANSMISSION chain industry this year will exceed its sales totals for the last two years. Reason: Its sales are linked to the national economy.

At the beginning of the year, power chain manufacturers were hoping they would reach 1954 sales levels.

Then It Happened—Farm equipment, which uses a lot of chain, began to enjoy an upswing in orders. Other users of chain in power transmission applications—earthmoving, conveyors, oil country, mining, food processing, construction and sawmill equipment—began to increase chain orders as their own backlogs grew. And the auto industry, enjoying what may be its best year, uses silent timing chains in engines. Aircraftmakers also use certain types in plane control systems.

Some 15 companies produce most of the domestic power transmission chain. It is sold to the consumer either direct or through manufacturers representatives. From 50 to 65 per cent is used for original equipment. The balance represents replacement business.

More Sales?—One producer reports: "We should all pay more attention to replacement sales. Chain lasts longer than drive sprockets. By the time the sprocket is worn, new types of chain and sprockets probably are in use. This means that a company should consider new, improved and more efficient power transmission chain when sprockets or chain need major repair. You can't get superior results with 5, 10 or 15-year-old chains."

Automation and plant expansion are opening broader sales horizons for power transmission chain applications. Chain is finding added acceptance because: 1. It is a positive power transmitter. 2. Exact timing is assured in machine operating cycles.

Some Problems — Steel roller, steel bar link and cast malleable iron chains are the main types used for power transmission. Forging grade steel is used for sprockets. The biggest problem shaping up for the second half of this year will be how to get enough steel, not where can more customers be found. The shortage of nickel, which is needed for the alloy steel which the industry specifies, may also threaten output. Chainmakers must also keep pace with machinery producers. This means that power transmission chain is constantly being upgraded to operate at higher speeds with greater load-carrying capacity.

Atom Business: $710 Million

By 1963 the annual volume for components of nuclear plants will add $710 million worth of business to the American economy, predicts the Atomic Industrial Forum.

The components, says Francis K. McCune, a GE vice president and general manager of the company's Atomic Products Division, "will consist of reactor units, heat exchangers, pumps, valves and fittings, piping, welding, tanks and auxiliaries, coolants, instrumentation, fuel handling equipment and auxiliary systems.

Although nuclear plants cost more than conventional ones, the beginning of the atomic power program is not expected to be greatly hindered because of two advantages:

1. Nuclear plants offer the greatest potential for cost reduction after start-up.

2. Work in the atomic field now will give an advantage when the rush to convert gets under way.

Atom Power: 5 Million Kw-Hr

The nation's first two atomic submarine propulsion plants, the *Nautilus* engine and its prototype, have generated more than 5 million kw-hr of electricity. Both engines use most of their power to turn propeller shafts, but turbine-generator sets are used for power generation.

Westinghouse Electric Corp., Pittsburgh, builder of the submarine power plants, is making the rector for a full-scale atomic-powered electric generating station at Shippingport, Pa.

Westinghouse also is working on two additional atomic submarines as well as development of a nuclear power plant for the propulsion of a large Navy surface ship.

SUP Begins To Filter Down

The Ford-type contract is setting the pattern thus far. One consolation: Experts believe it will cost 14, not 20, cents per hour per man

LABOR SETTLEMENTS involving Supplemental Unemployment Payments are beginning to be accepted by a few smaller firms. Some companies in nonautomotive fields have also taken on SUP.

Some 6000 tool and die workers in 76 Detroit-area plants won wage hikes up to 15 cents an hour in a new three-year contract which calls for a supplementary layoff pay plan. The companies affected will place 5 cents an hour for each hour worked by employees in a central pool. This fund will build up for one year. At this time, it has not been determined how much workers will be paid in case of layoff. Discharged workers will also be covered by the fund.

Another—Eaton Mfg. Co., Cleveland, has signed a wage contract with the CIO-United Auto Workers which extends the Ford-type settlement to this auto parts firm.

Though full details were not announced, a SUP plan is included. William McAuley, director of the UAW's Eaton council, remarked that benefits equaled those gained by Ford and GM employees. "It shows that smaller companies can afford the UAW package," he said.

The new contract covers about 4100 workers in four plants—Cleveland, Detroit, Battle Creek and Marshall, Mich. The company's Vassar, Mich., plant, where workers recently agreed to a 61-cent-an-hour pay cut to keep the plant from closing, is not involved. It is covered by another union.

One Out—A small auto stamper also has taken the plunge. Barcy-Nicholson Co., Detroit, has granted its 60 workers a new three-year contract which calls for SUP. The central pool plan includes a 5-cent-an-hour set-aside for each worker. There is one big loophole. E. J. Wood, industrial relations man at Barcy-Nicholson, reports: "We've agreed to go along and try it, but if it is found that we can't carry it because it affects our competitive position, we will go back and ask the union for wage cuts"

Others—Atlantic and Gulf ship operators have agreed to the employment security plan presented by the National Maritime Union. American Velvet Co. and the Textile Workers Union of America also have reached agreement on SUP. This covers some 500 workers. Men with ten or more years of seniority will receive $40 a week for a maximum of 52 weeks.

Meanwhile — Chrysler Corp. and the CIO-UAW are rolling up their sleeves as the initial sessions get under way. Chrysler's contract expires Aug. 31.

Point of interest: Some experts feel that the cost of the UAW package for Ford and GM is in the neighborhood of 14 rather than 20 cents an hour per worker.

Coming: Auto Contract Guide

The Department of Labor plans to issue a guide to states on whether to and how to tie their unemployment compensation programs to new auto contracts.

James P. Mitchell, labor secretary, reports: "The problem of integrating the private and public benefit plans is complex. Considerations vary from state to state." Within the next few weeks, the department hopes to have a report prepared which will make the government's position clear. Mr. Mitchell states that this is primarily a state problem and that the responsibility for decisions will be left with the states. The report will attempt to interpret and clarify where each state stands in relation to the contract agreements which have been approved by Ford Motor Co. and General Motors Corp.

Ford Spreads Benefits

Salaried Ford employees may have a chance at the stock purchase plan turned down by the United Auto Workers. Henry Ford II, president, said the company is thinking of contributing part of the purchase price of the stock.

Specific benefits already have been announced for 46,000 salaried Ford employees in the U. S., which parallel those granted hourly workers.

GE Machines 16-ton Turbine Rotor

A grooving lathe in General Electric Co.'s Large Steam Turbine-Generator plant at Schenectady, N. Y., machines the turbine rotor for the high pressure element of a large steam turbine-generator. The unit, rated 260,000 kw, will be installed in Detroit Edison Co.'s new River Rouge station. It will be of the cross-compound, double-flow, reheat design developed by General Electric since World War II. The unit will produce power for more than 700,000 people

Seven Steps to

1. **Set deadlines for all chief data and stick to them.**
2. **Balance accounts daily.**
3. **Set up a uniform chart of accounts and standard forms for reporting.**
4. **Don't sit on figures.**

Simplified accounting system helps management . . .

Put Financial Reports To Work

FIVE days after a month ends, Rockwell Mfg. Co.'s management gets a consolidated operating statement covering its 22 operating units.

"It can be put to use immediately, while problems are still fresh, while opportunity for action is greatest. The blind spot between operation and audit is shaved as much as several weeks from normal practices." That's how Munro Corbin, Rockwell's controller, describes the system's advantages.

Basis—The system depends upon the application of a relatively few principles rather than a high degree of mechanization in auditing departments. "Any small plant," says Mr. Corbin, "should have no trouble in meeting the schedule with an absolute minimum of equipment, generally limited to adding, calculating or bookkeeping machines."

No attempt is made to provide figures which an accountant would call precise. Instead, management gets a representative picture of a full month's shipments and expenses which is accurate enough for internal use. Deadlines are set on all principal data. Recording of some factors is started before the end of the month, and a "fiscal month" is set up for shipments in which the calendar month is set back no more than four days, depending on shipping location.

Benefits—The time gain results from not holding books open for vendors' invoices (which straggle in through the month) or for billing every possible shipment from all plants and warehouses. Firm schedules are set and adhered to.

To help operating units complete their bookwork on time, Rockwell accountants balance their accounts daily, closing out such items as shop payroll and customer billings. Totals are accumulated, so that there is no bottleneck when it's time to summarize the month's transactions.

Standard—Some 20 statements are submitted each month to the controller's office from each operating unit. A uniform chart of accounts, with each account identified by code number, is used by all plants. To simplify interplant transactions during the month, the same classifications are applied to all ledger accounts. Standard forms also are used for reports.

A standard cost system is another requirement. By converting all inventory charges to predetermined standard values, Rockwell eliminates the necessity for carrying so-called "actual" costs all through the accounting records. It also is able to cost shipments on a daily basis.

Simplification — Secondary distributions (management and divisional sales expenses—mainly applicable to multiplant companies), are eliminated from the books where possible. Prorated portions of such expenses are charged back on a statement basis rather than as book entries. Where book entries are essential, as in billing a subsidiary, the billing is recorded the following month.

Most of the work of preparing statements is done in advance. As a result, consolidation can proceed rapidly when the income and expense statements, balance sheets and other schedules arrive.

Speed—Perhaps the most significant consideration in making

Faster Financial Reports

5. Organize standard cost systems to permit immediate costing and daily recording.

6. Eliminate secondary distributions from the books where possible. These are mainly applicable to multiplant companies and include management and divisional sales expenses.

7. Systematize advance statement preparation and consolidation.

the accounting function more valuable to management is just plain doing it. "It is unfortunate but true," remarks Mr. Corbin, "that many accountants like to 'play house' with figures and delay monthly reports to management. Most of these delays are a result of habit rather than of necessity.

"This is proved by the short time — seldom more than one month—in which Rockwell customarily swings newly acquired companies into its accounting schedule. When a new company is taken over, the system is sold to it as a tested product of years of experience. To date, all have readily accepted the advantages of the change."

Workings — In practice, three sets of forms are mailed to the headquarters office from the divisions by the third workday after month end. These are profit and loss, balance sheet and a statement of accounts of purchases and sales of the other operating units of the company. General expenses, such as management, selling, freight-allowed and advertising are allocated at headquarters.

In the controller's office, the consolidated statement is prepared as the forms arrive. Although the third-day deadline of mailing from the operating units is sometimes missed, there is enough flexibility in mailing or telephoning the information that the five-day deadline can still be met.

Fifth-Day Report—The consolidated statement is distributed to the company's top operating officers and directors. It is made up of six main categories: Customer and interplant sales; cost of sales; manufacturing cost; plant expenses; plant operating profit; general expenses; and net and gross profit. Sales cost variances also are shown. In addition, figures for each month and totals for the year to date are indicated by amount and per cent of budget.

Meanwhile, the operating divisions mail in their additional report. This material is gathered into an operating report on each division or subsidiary. Data are analyzed in the controller's office and a resume is written.

Tenth-Day Report—This analysis, which contains an item-by-item explanation of trends and unusual patterns, is distributed on the tenth working day to all in the management group from plant manager up. It shows how the costs of labor, purchases and manufacturing compare with standard costs. It also covers inventory status and manufacturing cost variables, including such items as spoiled work and fixed charges.

Payoff—Mr. Corbin sums up: "At Rockwell, this fast measurement of how the company is faring affords management greater flexibility and a time advantage. It is better able to capitalize quickly on strengths and counter such profit drainers as creeping expenses, inventory imbalances and production or sales challenges from the competition."

• *Extra copies of this article are available in quantities from one to three until supply is exhausted. Write Editorial Department,* STEEL, *Penton Bldg., Cleveland 13, O.*

Selling Marginal Accounts

Check your approach to handling the small account before labeling it as an "unprofitable customer."

That advice was given by J. S. Hawley, marketing manager, Shakeproof division, Illinois Tool Works, at the American Marketing Association's convention.

From the chief factors which contribute to the unprofitability of an account, two broad classifications can be made: 1. The account has high potential with unsatisfactory sales factors. 2. The account has small potential.

Right Approach — Better salesmanship is the answer if a small client falls into the first category. The second classification takes special handling to make it a profitable account.

Mr. Hawley suggests: 1. If it is not feasible to send a personal engineering contact, easy-to-understand catalogs explaining the standard product line should be mailed after an initial sales call. 2. Inquiries and requests should be followed up by telephone or letter. Field offices often can perform this function and reduce the burden of follow-up calls. 3. Order handling must be efficient. Adequate stocks must be maintained; all basis for customer quality complaints must be eliminated. 4. Prices must be realistic and reflect the high unit process costs of small orders.

Mr. Hawley points out that usually 85 per cent of a company's volume is directed to 15 per cent of its customers. The small customer—the remaining 85 per cent—must be a strong secondary supporting element which helps to insure against loss of volume.

U.S. Tries To Break Patent Jam

IF YOU'RE awaiting a patent on a thingamajig, be patient.

It'll take 3½-years to get it through. American geniuses have been so inventive they've log-jammed the U. S. Patent Office with work. But the problem is nothing money won't solve, and therein lies the hope of the Patent Office.

More Men — An appropriation bill in Congress would give the Patent office $14 million, a $2-million increase. This additional sum would enable the Patent office to add 300 assistant examiners to its staff. They, plus the present 650 assistant examiners, would help the office keep current with the inflow of applications and perhaps reduce the backlog.

About 80,000 applications are rolling in a year, and the Patent office is falling behind 10,000 to 12,000 a year. On file is a backlog of 220,000 applications. It would take ten years to wipe it out, even if the 300 assistant examiners are added; they would come from the ranks of engineers, chemists and physicists. If they have no law training, they will be asked to take it while they work.

War Born—In the last two or three years there has been a big increase in applications. That happens after every war.

The Patent office is only about 50 per cent self-supporting. It hopes to close some of this gap by raising its fees, which have been unchanged since 1932. Proposals to raise fees are in two bills in Congress: H. R. 4983, introduced Mar. 16 by Rep. Emanuel Celler (Dem., N. Y.); and H. R. 6175, introduced May 11 by Rep. George H. Mahon (Dem., Tex.). Both bills were referred to the Judiciary committee.

Detail—Among the big changes proposed: A $10 increase (from $30 to $40) for applying for an original patent having five or fewer claims (except for design patents). A filing charge of $5 for each claim over five (it's now $1 for each claim over 20). A $20 increase (from $30 to $50) for the final fee on an original patent (except for design patents). A final charge of $5 for each claim over five (it's now $1 for each claim over 20). A $10 to $15 increase in filing fees for design patents, depending on how long they are for. A $10 increase (from $30 to $40) for application for the re-issue of a patent, and a $5 charge for each claim over five (it's now $1 for each claim over 20).

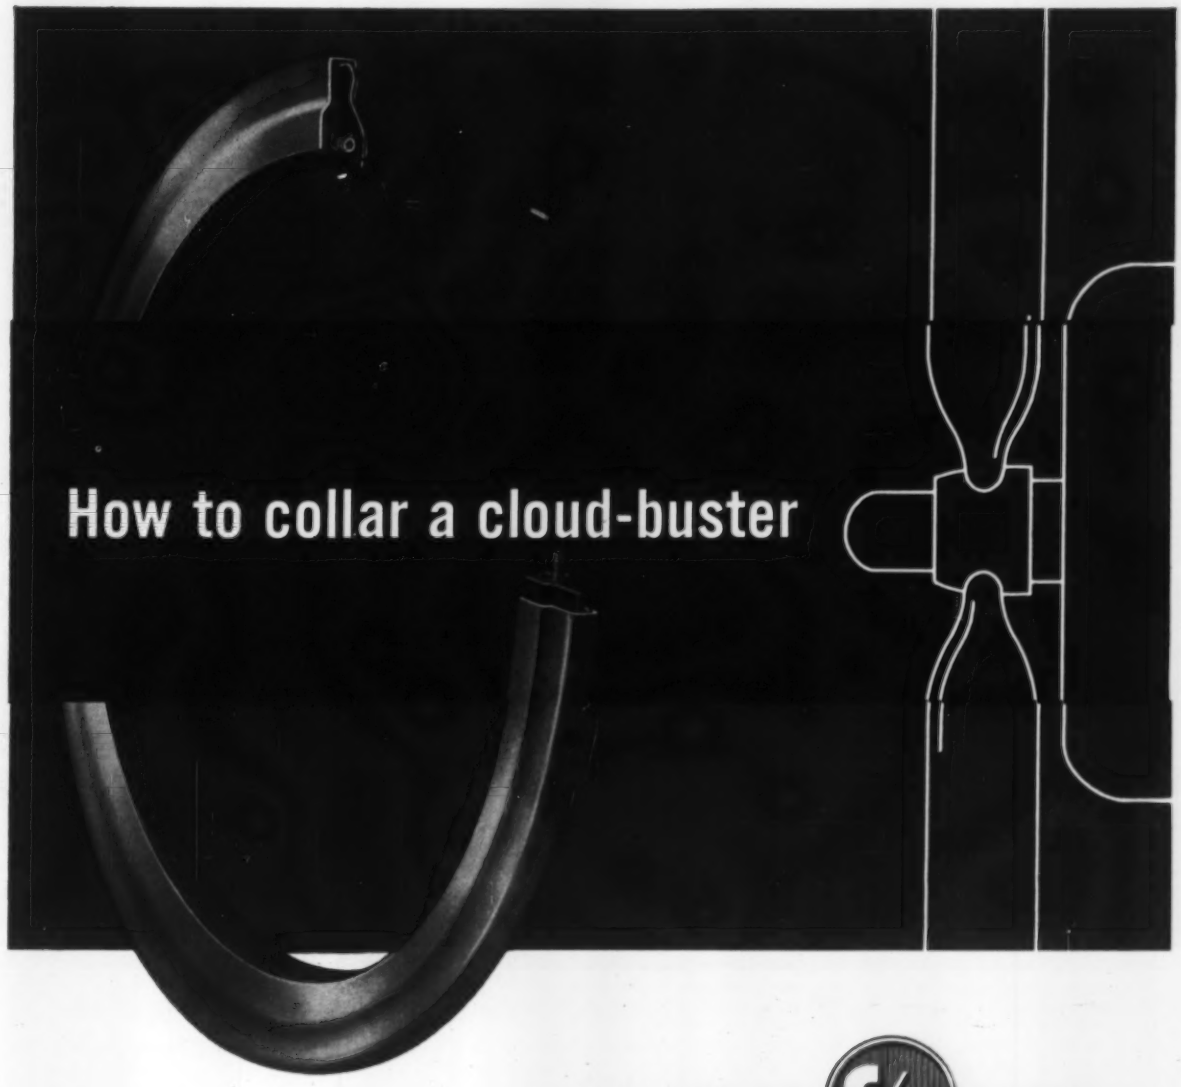
Changes proposed for trademark fees include a $5 boost for each original application. The new charge would be $30.

Washington Whispers

Willamette Iron & Steel Co., Portland, Oreg., was considered the lowest responsible bidder for a contract to convert two government-owned Mariner-type cargo ships into passenger liners for the Oceanic Steamship Co., San Francisco. Willamette's bid was $26,624,000 on a fixed basis. . . . Bethlehem Steel Corp. was awarded a $3,745,000 contract by the Defense department to convert the *USS Vanadis* from an attack cargo ship to a cable repairing or laying ship. . . . Pan Atlantic Steamship Corp., Mobile, Ala., applied to the Maritime Administration to construct seven new-type roll-on, roll-off ships to haul truck trailers. It would trade in to the government seven obsolete C-2 type ships. Cost of the new vessels would be $9 million each.

Meet George H. Compter: He is serving as a consultant on synchro and servo devices to the Electrical Equipment Division, Business & Defense Services Administration.

Mr. Compter is on leave from Ford Instrument Co., division of the Sperry Corp., where he is assistant to the vice president and secretary. At Ford Instrument, he is responsible for the long-range planning of component manufacture. In Washington, Mr. Compter may be contacted by calling Sterling 3-9200, Ext. 4241



AND BRING COSTS DOWN TO EARTH!

Where the propeller shaft enters the gear case, the design specs called for a piston ring seal. It was dependable . . . but through cooperative efforts of Curtiss Wright and C/R engineers, a simpler seal was designed, equally as dependable but saving space and cost. It works perfectly. This C/R seal provides lubricant retention sufficient to seal a vital bearing under severe conditions. This is a typical example of C/R seal engineering service. May we help you, too, with your sealing problems? Send for your copy of "C/R Perfect Oil Seals."

C/R

PERFECT
Oil Seals

More automobiles, farm equipment and industrial machines rely on C/R Oil Seals than on any similar sealing device.

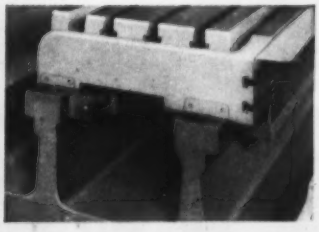
NEW CINCINNATI HyPowermatics

make quick work of your heavy duty milling operations

Convenient, compact grouping of operating controls reduces fatigue. HyPowermatic design will make a big hit with your operators.

Save the smooth surface made by face milling cutters, with Automatic Quill Retraction (optional equipment at extra cost).

Chip catcher bed design keeps the floor clean. Chips and cutting fluid stay where they belong, within the bed.



Hardened and ground table ways and square gib construction add their share to HyPowermatic's high cutting capacity.

You'll see costs tumble down when you assign your heavy duty milling operations to new CINCINNATI HyPowermatics. They have the capacity to remove metal quickly; they have new control features that help the operator turn out more work with no increase in effort. Reasons why are numerous:

1) Infinitely variable table feed rates, ¼" to 150" per minute
2) Hydramech table drive . . . assures uniformly smooth feeding motion
3) Built-in backlash eliminator . . . for down-milling and up-milling jobs
4) Automatic spindle stop . . . reduces occupational hazard
5) Automatic two-way table cycles
6) J.I.C. hydraulic and electrical standards
7) Unit type construction, two styles and 42 sizes of each of plain and duplex styles . . . an extra wide selection to fit your requirements

Eleven additional highlights of design and complete specifications for all HyPowermatics will be found in new catalog No. M-1871. Ask for a copy today . . . compare . . . and you'll see why CINCINNATI HyPowermatics can make quick work of your heavy duty milling operations.

J & L's Gottschalk Co-ordinates Shipping

KEEPING TRACK of some 16 million tons of steel and raw materials a year is the job assigned to C. W. Gottschalk, assistant vice president, traffic and transportation, Jones & Laughlin Steel Corp.

He develops plans, policies and programs involving transportation for the corporation and its subsidiaries. Prime requirements for handling the job: Experience and flexibility. Experience helps in handling consumer requests for the best way to route material. Flexibility is a must when orders rise or fall.

Quick Action—Mr. Gottschalk, who gained much of his experience serving with eastern railroads, states: "Any sudden upswing in sales means changes have to be made quickly by our division. Iron ore shipping schedules may have to be revised up or down. If the railroads cut down on serviceable freight cars because they anticipate a decline in carloadings and our shipments increase, we must do more work with less equipment." The division also guides the scheduling of barges and trucks which move raw materials and finished steel in and out of the mill.

Analyzing freight rates and operating a tracing department to expedite shipments are additional services Mr. Gottschalk supervises. And he represents the company and its subsidiaries before the Interstate Commerce Commission and state legislative groups.

Complications—"One plant's shipping schedules will demand that 88 per cent of its freight cars must be gondolas and 8 per cent boxcars. Another plant's products will require 47 per cent gondolas and 21 per cent boxcars. We must allow for each plant's specific requirements in our planning," comments Mr. Gottschalk. When a customer fails to provide instructions, Mr. Gottschalk must handle all routing directions.

"Service is paramount," he says. "Our customers want steel on time and in top condition. Overnight delivery by truck to heavy users helps reduce his steel inventory. Railroads are helping quick delivery by making great strides in designing new cars.

Breakdown—Last year the traffic and transportation division supervised the routing of 3.2 million tons of rolled steel products in addition to co-ordinating the movement of 5 million tons of coal and 1.3 million tons of limestone. Iron ore, the largest single item, will reach the 7-million ton mark this year, with shipping of finished products, coal and limestone rising substantially. Mr. Gottschalk will be kept busy talking with representatives from Pittsburgh's 125 railroad and steamship agencies.

Though Volkswagen dumps U. S. from second spot . . .

Detroit Wins Out in Export Mart

ALTHOUGH the U. S. is steadily losing ground to Western Europe as a direct exporter of automobiles, her interest in the world market is increasing.

In 1938 the U. S. provided over 60 per cent of world auto and truck exports. Last year her share was down to 30 per cent of the 1.3 million total. A German export push, spearheaded by the fast-selling Volkswagen, had displaced her as second largest exporter of cars, behind England.

Answer No. 1—American automakers are using a variety of approaches to foreign operations. In direct competition with the Volkswagen, for instance, GM has announced a $71-million expansion for Opel, its German subsidiary. Ford also is expanding its German operations.

These expansions are part of a world-wide spending program by Ford and GM. They have some 40 assembly plants and seven manufacturing plants between them in countries from Argentina to Australia. About $400 million is being spent to re-equip and modernize these foreign subsidiaries.

Answer No. 2—Ford and GM chose to compete by making smaller cars in the individual market areas. Chrysler Corp. is making money in the foreign "luxury" market by exporting modified Plymouths, De Sotos and Chryslers direct from Detroit. Says C. B. Thomas, vice president of the export division: "Our sales were up 10 per cent last year from 1953 and are running 25 per cent better this year."

Of the Independents, Kaiser Corp. has a $12-million expansion planned for its Argentinian subsidiary. It hopes to achieve full production of 40,000 units a year by 1958.

Answer No. 3—American Motors Corp. imports cars to the U. S. under an arrangement with Austin of England. This company —England's biggest producer— builds the Nash Metropolitan for export to the American domestic market. "The Metropolitan is now America's best-selling import," says George Romney, president of American Motors. Orders for an additional 20,000 units have been placed in England.

There is room for different approaches in competing for the booming global auto market. Outstanding growth areas are in opposite corners of the world. New Zealand and Brazil imported twice as many motor vehicles in 1954 than in 1953. Imports into Sweden increased about 50 per cent.

Growth—Free world auto output (excluding the U. S.) has enjoyed a steady growth since 1948, when it was about 668,000 units. By 1950, it had reached 1.4 million. It hit 1.8 million in 1953 and 2.2 million last year. The rate of growth has been twice as fast as that in North America.

Output is still going up. Prospects are for at least a 10-percent gain this year. Direct export figures notwithstanding, American automakers will be getting their share of sales.

Big building programs pose the question . . .

Capacity Race in Autos?

AUTOMAKER REPORTS of expenditures for facility expansions run a close second, numerically, to reports of broken production records.

When the two are placed side by side, a reasonable question arises as to what the auto companies are going to do with more facilities when they already can produce at a rate of 8.5 million units for an annual market of only about 6 to 6.5 million vehicles.

Are the automakers, to put it bluntly, in a capacity race?

The Facts — Auto companies don't deny that capacity is being increased through expansion and modernization. Since the end of World War II, General Motors has committed $4 billion to capital investment in the United States and Canada. Chrysler Corp. has expenditures in the works which bring its total to $625 million, and Ford Motor Co. outlays will soon total $2325 million since World War II.

Somewhat in the manner that they deny the existence of a horsepower race, auto companies queried by STEEL last week explained that they are merely "meeting the needs of an expanding market." This blue-sky factuality contains an inference that the competition in the auto industry is nothing more than a somewhat boring price of popularity. But the fun begins when you attempt to probe into what market it is the automakers expect to meet.

The Figures — Immediately at hand are population growth and economic trend charts which make a total annual output of 8 million passenger cars seem fairly plausible within the next decade. But the question arises when it is noted that the automakers already can produce at a rate in excess of their expected market ten years from now.

In a nutshell, the explanation lies in the fact that each company is expanding capacity to meet its own expected market rather than the industry's expected market. It's fairly obvious that you can't sell cars you can't produce, so the rationale of expanded facilities adds up. On the other hand, sometimes you can't sell cars you can produce, in which case the overhead adds up.

The Dilemma—This constitutes a

(Material in this department is protected by copyright, and its use in any form without permission is prohibited.)

dilemma and explains why some auto company executives make large salaries. It also is a simplification of an extremely complex problem.

In the intensely competitive auto production field, unit cost is extremely important. This is true to the extent that automakers carefully dissect each others' products, checking materials, manufacturing methods and tolerances, and upon this information attempt to arrive at a unit cost figure. But a big factor in the key to unit cost is overhead and labor, factors which are directly related to capacity.

The Key — The usual definition of capacity is the production rate at maximum efficiency, the output which the plant was intended to produce. But like steelmakers, automakers can and do produce in excess of capacity. When that happens, unit costs go up.

It's rule of thumb in the auto industry that it takes about 4 man-hours in the assembly plant for each car produced daily. Thus, about 600 workers are required on the assembly line in a plant turning out 1200 cars on an 8-hour shift. To produce more cars, more man-hours must be added and that usually is overtime or premium shift operation. Then, too, as the conveyor is speeded up, keeping inventories in balance and workers out of each others' way nips at smooth operation. Compound this with the same thing happening in plants supplying the assembly line and the buoying effect on unit costs is not difficult to imagine.

The Reason—Yet there are good reasons for the automakers to produce beyond maximum efficiency. When new models hit the market, it's generally accepted that getting plenty of cars on the road quickly has much to do with sales success. The reasoning is that the more cars of the make people see on the road, the more inclined they are to accept the design as what a car ought to look like. And all this turns into a vicious circle of sales success which sales managers dream about.

As a negative illustration, perhaps you recall the delay in getting the new Studebaker design into production in 1953 after one of the most sensational publicity breaks in many years. Most industry people figure the car would have had considerably greater sales success had deliveries been able to ride the boom of public interest.

The Catalyst—But it's not just the initial model impact that's important. Demand which fluctuates with the seasons must be met or the chances are relatively high that the customer will buy an available competitive make. If he does, the odds are 3 to 1 he'll buy another in 2½-years. So output must be maintained even in the face of less than maximum efficiency and lower unit profit due to higher unit cost.

Much of the expansion and modernization which is taking place in the auto industry may be interpreted as reducing the need for above-capacity operations. But at the same time it permits the company to produce the same number of cars at lower unit cost, it also increases the ability to produce at over-capacity.

The Rationale—Since excess capacity constitutes overhead which adds to unit cost, a limit is fixed by the expected volume of the company. This is determined by analysis of the general economic climate, sales trends of the various makes and appraisal of the potential of future product designs. Also involved is the existing need to balance capacity. The whole forms a nebulous map for expansion and modernization whose genesis is independent of competition while its being is dependent on competition.

This situation makes it difficult to answer the question: Is there a capacity race?

Perhaps the best answer is simply that there is a never-ending battle in the industry to produce at competitive cost and to sell as many cars as possible. In both areas proper capacity balance is essential as shown above. It seems safe to state that no company is garnering capacity it does not expect to be able to use just for the sake of capacity.

The Result—Likewise, no company views its future darkly. The auto companies see continued growth of the economy. Moreover, each sees growth for itself within the economy and the industry on which it is betting its expansion dollars. Taking a long-term view, observers expect the rate of expansion and modernization to continue at or near present levels for some time to come.

The mere fact that automakers feel that way and translate their feelings into purchases may have much to do with the ultimate correctness of their view.

New Auto Designs Ahead?

The automobile industry is preparing an abrupt and radical departure in design, says *Ward's Automotive Reports*. Timing will be planned to take best advantage of current expansion programs.

With the introduction of 1957 models, look for the elimination of the 50-year-old "flat-sided look." Curved side windows and body panels, lower silhouettes and smaller diameter wheels will be the main differences. The side windows will be mounted flush with the car exterior, requiring new door design. Up-and-down wrap-around rear windows also are earmarked for introduction.

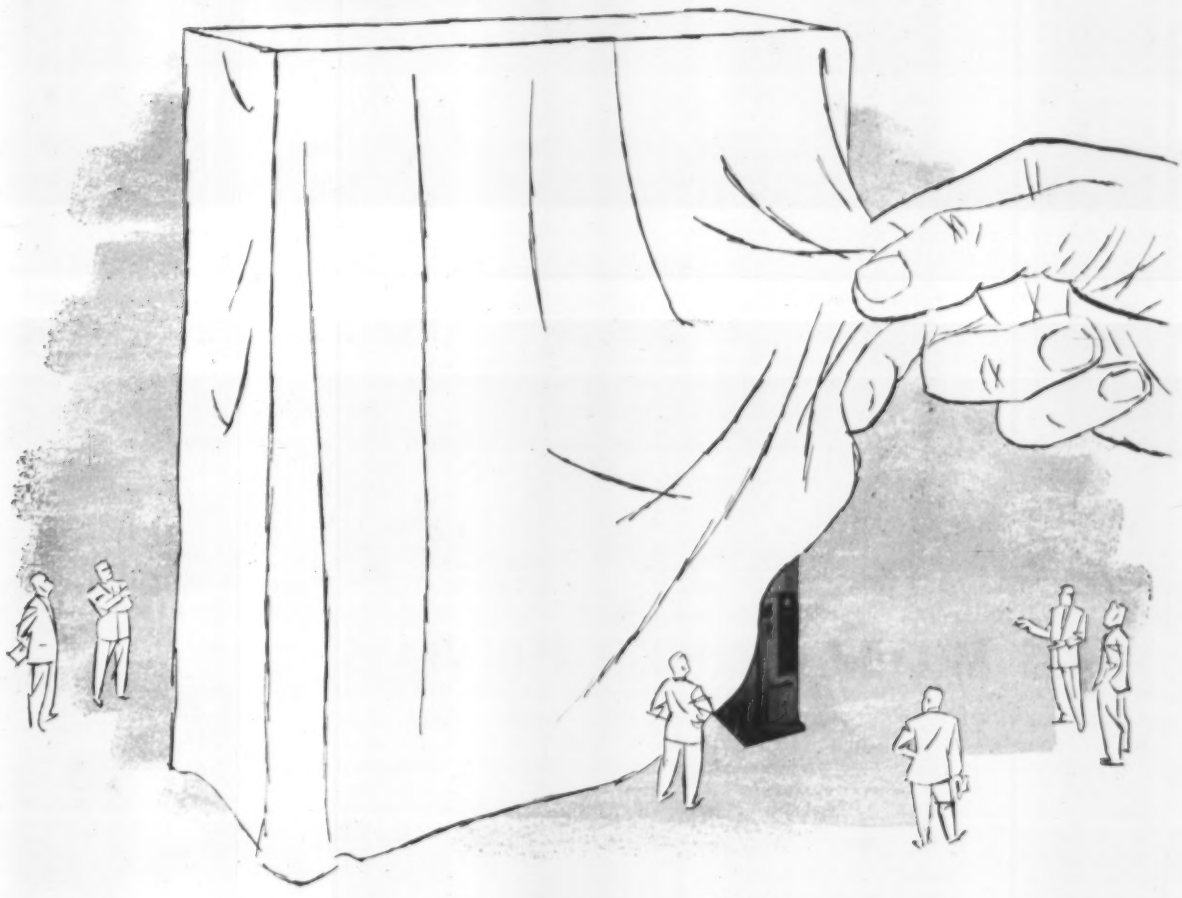
The new rear window treatment may appear first in several four-door soft-top convertibles, now being readied for production. Standard soft-top convertibles already are extinct at Nash, Hudson and Studebaker and are a money-losing item for many other producers.

YOU ARE CORDIALLY INVITED TO THE

Verson

OPEN HOUSE

September 6 to 17



and the Unveiling of the Largest Double-Action Mechanical Press in the World

While in Chicago, during the Machine Tool Show, be sure to visit the Verson plant. Verson presses will be in operation for your examination in our new Research, Development and Exhibit Center.

Unveiling and presentation of the new Verson double-action mechanical press, the largest in the world, will take place during the Open House. It's the one event that you don't want to miss while in Chicago.

Write today. Plan your trip to the Verson Open House now. We will be pleased to arrange transportation for you between the Show, or your hotel, and the Verson plant.

BRASS MELTING THROUGH 150 YEARS

According to tradition and available records, founders of the Scovill Mfg. Co. of Waterbury, Conn. were first in the New World to cast brass bars commercially for subsequent cold rolling, at the old Abel Porter casting shop in Waterbury, Conn.

From this modest beginning has grown the huge Scovill Works employing thousands of employees and producing enormous quantities of cold-rolled brass. One of the initial steps in the process is the melting of brass in three of the largest and most powerful electric melting furnaces ever made, one of which is shown in the picture above.

In the early 1800's the man-hour rate of production with charcoal pit fires was from 5 to 10 lbs. In the early 1920's when AJAX INDUCTION FURNACES were installed, the man-hour rate was 800 lbs. Since 1949 when the latest type AJAX furnaces were installed man-hour production has increased five fold, and is now 4,000 lbs.

These modern 1000 KW AJAX Furnaces have a holding capacity of 20,000 lbs. with an hourly melting rate of 5 to 5½ tons.

Photos at right show a unique demonstration staged by Scovill at the Hotel Statler in Hartford of America's first practical brass casting method. Here an operator in authentic brass caster's clothes of the period illustrated the casting of metal melted by the old bellows-blown pit fire used in the early 1800's. The tools were loaned by the Mattatuck Historical Society of Waterbury.

Business Pickup Fans Out as It Slows Down

SIGNPOSTS of good business are plentiful in metalworking.

Steel production has been rolling along at 95 per cent of capacity or better since April. That super-rate may drop off moderately during the summer, but pepped-up auto demand following model changeover in middle and late summer will snap up much of any looseness that comes along.

Cleanup — Auto sales have slipped from April and May peaks though not enough to dash hopes that dealer inventories will be in good shape by the time 1956 models come out.

Production is still high—higher than was planned just a few weeks ago. But it will slow down when producers recoup strike losses. Ford is humming along at full throttle (except for Lincoln, already down for change-over). General Motors is hit by parts shortages, an aftermath of labor negotiation walkouts, but is champing at the bit and ready to jack up production as soon as possible.

Building—Chrysler output is tapering off, heading for a late-this-month change-over start. The Independents are running well ahead of last year's volume.

Construction continues to be an economic mainstay. The government estimates a rise to $41.8 billion this year, 11 per cent above last year's record. Housing will have its second best year, beaten out only by 1950. Looked for are 1.3 million starts.

Excellence—Heavy construction alone is 38 per cent ahead of last year and 14 per cent above 1953, the previous best, reports *Engineering News-Record*.

Business in the industrial heating industry continues excellent, announces Carl L. Ipsen, executive vice president of the Industrial Heating Equipment Association. Orders through May are 57 per cent ahead of last year's.

May itself was a record breaker. It topped by 6 per cent the previous high set last May. Bookings

Gas Appliance Mfrs. Assn.
*Preliminary.

hit $6.2 million; a year ago they were $5.8 million. Orders in the first five months are $31.7 million, compared with $20.2 million a year ago.

Materials handling executives at the first of the year saw a 15 per cent sales rise coming in 1955. Now some have raised their sights to 25 per cent, says the Material Handling Institute Inc. Average gain for the first five months is 18 per cent. One reason for the greater optimism: Record or near-record spending ahead for new plant and equipment.

More Freight Car Orders . . .

Even railroads are getting into the act. Predictions are for freight car buying at more than triple the 3100-per-month rate of the first five months. Buying plans announced by several roads in the last couple of weeks indicate that estimate won't be far off.

The car buying is in response to increased rail traffic. Carloadings to date are 8.7 per cent above a year ago's; the number of cars available is down about 50,000.

Continuing good traffic (and industrial activity) for the Great Lakes region, at least, is pointed to by the Regional Shippers Advisory Board's prediction of a 20-per-cent increase in carloadings in the third quarter.

Raw Materials for Steel . . .

Across the nation, coke, coal and ore are leading the traffic upswing. Coke shipments are up almost 30 per cent from last year's; coal and ore, 17 per cent. It follows that coal production also is up, nearly 20 per cent, according to National Coal Association figures.

Locomotive backlogs made a small gain to 385 as of June 1, compared with 360 a month earlier. On Apr. 1, though, 428 were on order. But it's still more than double the 170 on order a year ago.

TV Set Makers Optimistic . . .

Radio and television set manufacturers and their component suppliers are optimistic about the outlook for black-and-white television receivers and radios.

"Guesstimates" taken by Radio-Electronics-Television Manufacturers Association go like this: In 1955, 7 million to 7.3 million black-and-white TV sets and 12.5 million to 13 million radios, includ-

ing 4.5 to 5 million auto sets.

In 1956, 6.5 million to 7.3 million black-and-white TVs. Record year to date for TV sets was 1954 when 7.3 million were sold. For color TV, consensus was for 35,000 sales in 1955, between 250,000 and 300,000 in 1956.

Business Is Good, Say PAs . . .

Another reporter of excellent business is the National Association of Purchasing Agents. For June, 36 per cent of the PAs report higher production, 33 per cent higher new orders.

While that's not a bad showing, it's still the lowest since last summer, indicating that the rapid rate of business pickup may be slackening. But reinforcing the view that business is good, only 7 per cent report production dips; only 14 per cent say new orders are down.

Another reason for optimism is a rising inventory level. It's needed to back up higher production and give a cushion of materials in tight supply like steel, copper and nickel. Employment is still climbing. PAs reporting additions to payrolls outnumber fivefold those reporting cutbacks.

Buying policy on production materials remains 90 days or less where possible. For capital additions, lead time is six months or more. Prices continue a slow rise, but tight competition has brought about lower than "book" prices on some items.

Trends Fore and Aft . . .

New orders for industrial supplies and machinery in May jumped to 191.6 (July, 1948 = 100), highest since the Korean War, reports the American Supply & Machinery Manufacturers' Association. Only in the first four months of 1951 have orders been higher . . . April sales of automobile replacement parts broke the dollar-volume record set in July, 1948, by 11 per cent, but physical volume was off 15 per cent. The Automotive Parts Manufacturers Association says a dip may come in two or three months. Sales have been on the upgrade for 13 months. They usually follow close behind retail sales, and they are on the way down . . . Metal weatherstripping sales in May were 29.5 per cent above the same month last year, reports the Weatherstrip Research Institute. Sales the first five months are 32 per cent over the like 1954 period.

NEW SERIES OF HARDENABLE STAINLESS ALLOYS

A new series of corrosion resistant precipitation hardenable stainless steel alloys has just been announced by the Research Division of Cooper Alloy Corporation. Designated PH55A, PH55B, PH55C and PH20, the four new alloys are designed to meet the following needs:

PH55A—A high strength and high hardness alloy with fair ductility, for erosion and abrasion resistance or for stressed parts in corrosive applications.

PH55B—A ductile high strength alloy of medium hardness, for shock resistance and high stresses in corrosive applications.

PH55C—A very high hardness alloy of low ductility for non-stressed, corrosion resisting parts.

PH20 —A gall resistant alloy with superior corrosion resistance.

All three alloys in the PH55 series are variations of the 19% chromium, 9% nickel analysis. By introducing and varying molybdenum, copper and silicon and controlling the carbon below .08% and the manganese below 1%, variations in hardness and ductility are achieved. The corrosion resistance of these three alloys equals or surpasses that of type 316 stainless; average Brinell hardness for Cooper Alloy PH55A, B and C is 341, 293, and 415 respectively. Cooper Alloy type PH20 is a precipitation hardenable version of the 20% chromium, 29% nickel type 20 alloy which has unusually good resistance in hot sulphuric acid and superior resistance to a long list of corrosive solutions. Average Brinell hardness of 229 can be achieved with this alloy, as compared with 130 B.H.N. for the standard 20 type alloy.

The new series of alloys fills a much needed gap in mechanical and chemical properties between 17-4PH and Cooper Alloy V2B on the higher end. Patents are pending and the alloys will be made available on a license basis. Data on request.

SPEED-UP YOUR SHEET HANDLING...
MAKE IT SAFER...REDUCE COSTS
with the new Heppenstall Sheet Lifter

This latest addition to the Heppenstall line of tongs has remarkable safety and ease-of-operation features that will save you both time and expense. Its design and construction solve many problems in sheet handling, and offer you these important advantages:

1. **No manual adjustment required for sheets of different widths.**
2. **Decreases sheet damage because of straight line motion of lifting arms.**
3. **Cannot lose load because of self-locking brake.**
4. **Available in hand or motor operated models.**
5. **Unlimited capacities.**
6. **End Grabs for use with very wide or very long sheets can be added as optional equipment.**
7. **Designed to fit any crane block and hook equipment.**

STRAIGHT LINE MOTION OF GRABS. There is no up and down arc . . . vertical members remain vertical and the lifting angle moves in and out parallel to the floor. This action greatly reduces the possibility of damage to the sheets.

MANUALLY OPERATED SHEET LIFTER: Available with either chain or wheel operation.

TONGS FOR EVERY LIFTING PROBLEM

HEPPENSTALL COMPANY

NEW BRIGHTON, PA.

CARL McFARLIN SR.
. . . *Merritt-Chapman & Scott exec. v. p.*

E. W. ADAMS
. . . *to head a new Kaiser Alum. plant*

H. EDWARD NEALE
. . . *Bullard Co. sales manager*

Carl McFarlin Sr. was elected an executive vice president of **Merritt-Chapman & Scott Corp.**, New York, in charge of the chemical, paint and metallurgical division. Mr. McFarlin is president and a director of Tennessee Products & Chemical Corp., Nashville, Tenn., which became a member of the M-C &S chemical, paint and metallurgical division following its recent acquisition by Merritt-Chapman. He continues headquarters at Nashville.

Keith G. Splude was made sales manager, brake division, **Stearns Magnetic Inc.**, Milwaukee. He was an application engineer at Louis Allis Co.

William Brown was made director of engineering, consumer products, **Webster-Chicago Corp.**, Chicago.

Ford R. Snyder was elected a vice president of **Hickman, Williams & Co.**, with headquarters in Chicago.

Chrysler Corp., Detroit, appointed **Melvin F. Auch** assistant general purchasing agent for administration, and **Gordon K. Price** assistant general purchasing agent for production.

George F. Groff was made secretary of **Crucible Steel Co. of America**, Pittsburgh. He succeeds the late **Kurt R. Vogel.** Mr. Groff continues as vice president-finance.

E. W. Adams was made plant manager of **Kaiser Aluminum & Chemical Corp.'s** new basic refractory brick plant soon to be constructed at Columbiana, O. **F. W. Wright** of the Henry J. Kaiser Construction Co. was appointed resident manager of the construction project, and now is headquartered in Columbiana.

Ellis J. O'Brien was made standard products sales manager for **Heyl & Patterson Inc.**, Pittsburgh. He was chief development engineer.

Arthur E. Peltosalo was made manager of specialty capacitor sales in the capacitor department of **General Electric Co.** at Hudson Falls, N. Y. He replaces **D. J. Harrington**, now manager of marketing for the appliance control department.

H. K. Porter Inc., Somerville, Mass., appointed **Harry M. Webster** sales manager of trade sales, in charge of cutter, pruner and automotive trade sales. He was sales manager, cutter and industrial division.

Gerald J. Halpin Sr. was appointed vice president-sales, **American LaFrance Corp.**, Elmira, N. Y. He succeeds **James O. Binford**, who was granted an indefinite leave of absence. Mr. Halpin was general sales manager.

H. Edward Neale was appointed sales manager of **Bullard Co.**, Bridgeport, Conn. Formerly assistant sales manager, he succeeds **Frank U. Hayes**, a vice president of the company, who was made assistant general manager.

Peters-Dalton Inc., Detroit, promoted **Robert G. Callison**, sales manager, to vice president in charge of regional sales and sales promotion. **T. Kenneth McGuire**, general manager of the industrial sheet metal division, was made general sales manager.

Beals, McCarthy & Rogers Inc., Buffalo, promoted **Robert E. Mills**, purchasing agent, to vice president. **Carl W. Gregory**, comptroller, was elected secretary.

Ahlberg Bearing Co., Chicago, appointed **Ernest J. Klimczak** general manager and **Melvin G. McGregor** sales manager.

James W. Tulloss was made general manufacturing manager of **Lyon Inc.**, Detroit. He is succeeded by **Harry J. Eyman** as production manager.

Hooker Electrochemical Co., Niagara Falls, N. Y., elected **R. Lindley Murray** chairman of the board to succeed **Edwin R. Bartlett**, who resigned to become chairman of the newly created finance committee. **Bjarne Klaussen**, former

M. T. O'DONNELL
. . . a Chrysler Division v. p.

RUDOLPH FURRER
. . . new position at ACF Industries

CHARLES B. GRACE
. . . to be president of Heintz Mfg.

executive vice president, was elected president.

M. T. O'Donnell was elected vice president, **Chrysler Division**, Chrysler Corp., Detroit. Since 1954 he has served as special assistant to the president, in charge of manufacturing and organization divisionalization. Before that, he was assistant general works manager of the division. **Clare E. Briggs**, who joined Chrysler Division last March as assistant to the president in charge of sales, was elected vice president-sales.

American Steel Foundries appointed **John A. Rassenfoss** manager of its manufacturing research laboratory at East Chicago, Ind. **C. G. Mickelson** and **P. J. Neff** were made assistant managers.

Joseph G. Hrosenchik was named South Bend, Ind., district sales manager for **De Walt Inc.**, subsidiary of American Machine & Foundry Co.

Detroit Steel Corp., Detroit, appointed **T. R. Adams** eastern sales manager at its Hamden, Conn., plant; **D. H. Mathews**, Detroit district sales manager; **R. T. Brown**, manager, Toledo, O., sales office.

Bruce D. Henderson, vice president of **Westinghouse Electric Corp.**, Pittsburgh, was appointed to the apparatus products staff. He is succeeded as general manager, purchases and traffic, by **A. M. Kennedy Jr.**

Rudolph Furrer, vice president of **ACF Industries Inc.**, New York, formerly in charge of the nuclear energy and special products division, was made vice president in charge of manufacturing and engineering of the parent company. He also becomes president of the Nuclear Energy Products Division. **John E. Angst**, district sales manager of **American Car & Foundry Division** of ACF, was elected vice president-sales, with headquarters in Chicago; and **Ellsworth B. Carpenter**, western sales manager, American Car & Foundry Division, was made vice president-sales, with headquarters in St. Louis.

Raymond H. Higgins was made sales engineer for **Portland Copper & Tank Works**, South Portland, Me.

Hartman Metal Fabricators Inc., Rochester, N. Y., appointed **Jerome L. Huff** sales manager. He was assistant sales manager of Mandeville & King Co.

M. O. Messenger was made vice president and general sales manager of **Koehring-Waterous Ltd.**, Brantford, Ont., subsidiary of Koehring Co. He succeeds **Donald M. Waterous** who resigned in 1954. Mr. Messenger, since 1953, has been at Koehring's main plant in Milwaukee as assistant sales manager, and also directed the distributor sales school in Milwaukee and in the field.

Charles B. Grace, vice president and secretary-treasurer of **Heintz Mfg. Co.**, Philadelphia, will become its president, effective Aug. 1. He will succeed **William J. Meinel**, who continues as chairman of the board, a post he has held since 1943. Mr. Grace will retain his post as treasurer, but relinquishes his post as secretary. **John H. Thacher**, manager of quality control, is his successor.

Carl Beltz was made manager of air conditioning equipment, **Star Steel Supply Co.** and **Burton Co.**, Detroit.

A. R. Schneller, Pacific Coast sales manager for the welding products division of **A. O. Smith Corp.**, was made eastern regional sales manager for the division. The corporation operates its eastern electrode manufacturing plant at Leola, Pa.

Butler Bin Co., Waukesha, Wis., elected **Kenneth P. Kerr** vice president-sales and **Morgan R. Butler Jr.** vice president-production.

Appointments at United States Rubber Co.'s **Naugatuck Chemical Division**, Naugatuck, Conn., include: **Earle S. Ebers**, general sales manager; **D. Lorin Schoene**, director of research and development; **F. Dudley Chittenden**, production manager. **Robert E. Casey**, former general sales manager, was made marketing co-ordinator. **C. H. Madsen**, former

Users of tubing for cylinder applications—now you can have this new...

J&L Cold Drawn ELECTRICWELD

Tubing with a Special Smooth ID Finish

Reduces your overall production costs in applications like these . . .

- **cylinder tubing**
- **hydraulic and pressure tubing**
- **shock absorbers**
- **ordnance components**

This new drawn-over-mandrel grade tubing with its mirror-like inside surface finish is today busy helping manufacturers reduce or entirely eliminate costly machining on many applications and is being substituted for more costly types of steel tubing. For example, it may be used, without inside honing, for many cylinders through which plungers are passed.

J&L Cold Drawn ELECTRICWELD Tubing with a *Special Smooth* ID finish combines the physical advantages imparted by today's modern electric welding techniques with those of cold working. It withstands high internal hydrostatic pressures, carries heavy torsion loads, resists high-frequency vibration, and offers a favorable weight-to-strength ratio for applications in which loading occurs in all directions.

J&L Cold Drawn ELECTRICWELD Tubing can be furnished in its three specifications in OD sizes from ¾-inch to 2¼ inches and in wall thickness from 20 to 10 gage, 0.035 and 0.134-inch respectively.

This new booklet provides the information you need . . . specifications . . . tolerances . . . chemistry . . . mechanical properties . . . annealing . . . finishes.

Send for your free copy today!

production manager, was made product manager for chemicals and explosives.

Thomas G. Lewis was appointed assistant to the director of purchases at **Youngstown Sheet & Tube Co.**, Youngstown. He will supervise the purchases of special projects, including the larger construction programs.

J. Russell McGee was made manager of distributor sales by **Danly Machine Specialties Inc.**, Chicago. He was Midwest district sales manager for Skil Corp.

Earl Swanson was named cutting division manager, **Diamond Machine Tool Co.**, Pico, Calif.

Ohio Steel Foundry Co. appointed **Frank B. Stauffer** as its West Coast representative. His office is in Oakland, Calif.

Otto W. Franke was made manager of the new central production engineering department of **Chrysler Corp.**, Detroit. He was operating manager of the Dodge Division.

H. Jerome Olson was elected vice president - manufacturing, **D. W. Onan & Sons Inc.**, Minneapolis. Formerly production manager, he has been with the firm 14 years. In addition to manufacturing departments, he now is in charge of machine shop, assembly, stock and warehousing departments, as well as maintenance, procurement and purchasing, traffic and shipping.

F. Carroll Stille, sales manager, was elected a vice president of **Corhill Corp.**, Hoboken, N. J., subsidiary of Cornell & Underhill Inc.

Walter A. Barz, purchasing agent, **Calumet Division**, Calumet & Hecla Inc., Calumet, Mich., was appointed purchasing manager to succeed **L. H. Donald**, retired.

Jack B. May, former vice president, Benjamin Wolff & Co., was named manager of general products for **Production Steel Co. of Illinois**, Broadview, Ill.

Roger P. Filbert was elected president and chairman of **Oklo Industries Inc.**, San Diego, Calif.

Wilbur H. Peter Jr., formerly works manager, **Electric Controller & Mfg. Co.**, Cleveland, was elected vice president and works manager.

Adm. Alan G. Kirk, chairman and president of Mercast Corp., also has been elected president of **Alloy Precision Castings Co.**, Cleveland, following resignation of **Ronald D. Gumbert.** Admiral Kirk continues to serve as chairman of Alloy, a subsidiary of Mercast. **Frank W. Glaser** was made general manager, continuing as vice president.

E. E. Locke was made sales manager, Los Angeles warehouse division, **Caine Steel Co.**

L. W. Buechler was named chief engineer for **Vickers Electric Division**, Vickers Inc., St. Louis. He was manager of control product sales for the division.

Oliver A. Gottschalk was elected treasurer-controller, **Carborundum Co.**, Niagara Falls, N. Y. He is succeeded as assistant to the president by **George J. Zimmerman.**

OBITUARIES . . .

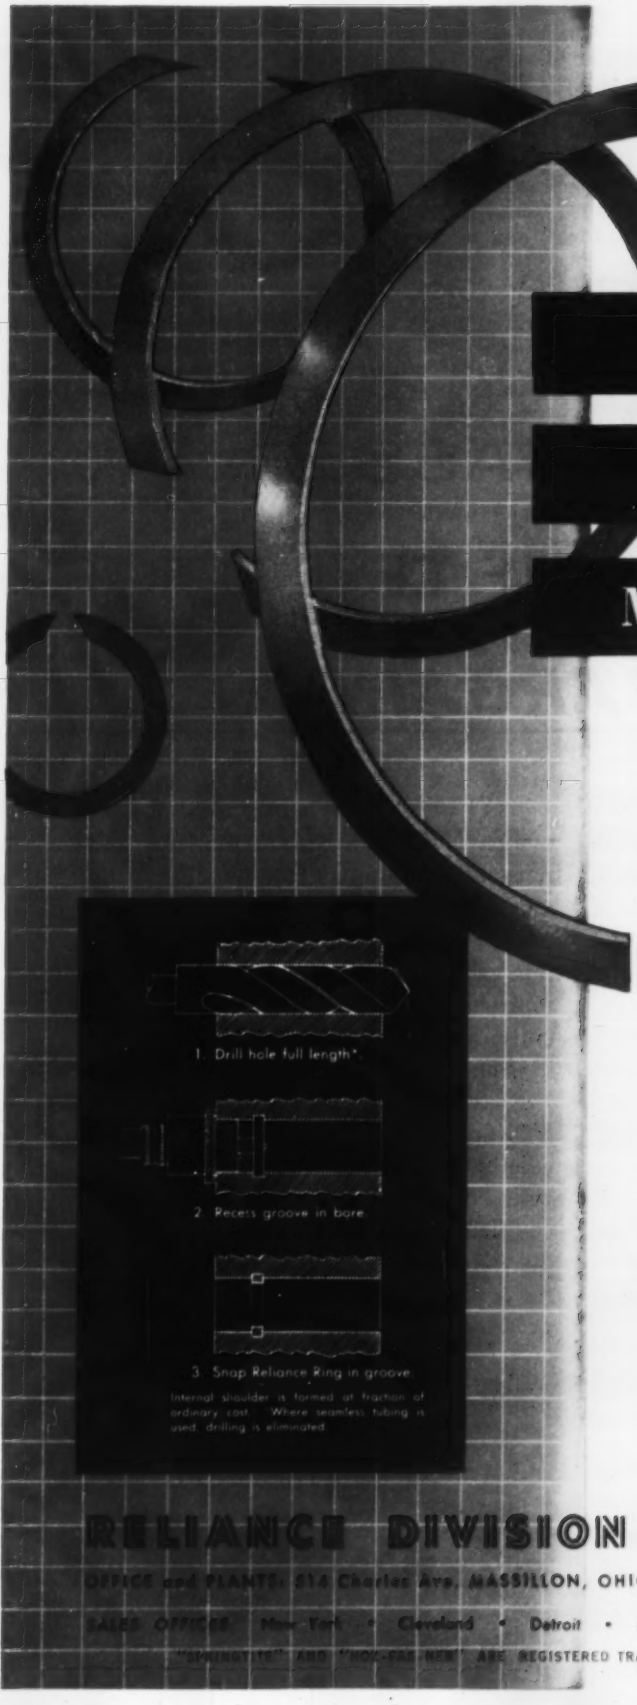
Hugh H. Glen, 57, president, **Johnson Pump Co.**, Pasadena, Calif., died June 16.

Fuller F. Barnes, 68, president and chairman, **Associated Spring Corp.**, Bristol, Conn., from 1923 until retirement in 1954, died June 18.

William I. Grantham, 67, operator of **Niagara Welding & Boiler Co.**, Niagara Falls, N. Y., died June 16.

Dr. Rufus E. Zimmerman, 68, retired vice president and chairman of the research policy committee, **United States Steel Corp.**, New York, died June 21. The American Society for Metals awarded him its medal for advancement of research in 1946.

Peter G. H. McInnes, 76, one-time president of **Hamilton Tool Co.**, San Diego, Calif., died June 14.



1. Drill hole full length*
2. Recess groove in bore
3. Snap Reliance Ring in groove
Internal shoulder is formed at fraction of ordinary cost. Where seamless tubing is used, drilling is eliminated.

Reliance

SNAP RINGS

Save Man Hours

Money and Material

Now it's easy to position gears and bearings on shafts without resorting to countless hours of intricate and expensive machining operations. Nor do you sacrifice quality when you let Reliance Snap Rings do the same job on shaft assemblies, bearing applications and counterbores that formerly required many man hours and wasted materials.

Reliance Snap Rings form a solid shoulder able to withstand predetermined thrust loads simply by machining a groove into a shaft and snapping in a Reliance Ring. Compare this to the waste in time and materials of machining the entire length of the shaft to form a shoulder. Wherever it is practical from a design standpoint, Reliance engineers can show you how to save man hours, money and material by switching from expensive machining operations to Reliance Snap Rings. You will find more detailed information in our Engineering Folder 4K/3 which we will be happy to send at your request with no obligation.

A ***BARGAIN***

THAT BY-PASSES

THE DISTRIBUTOR

IS NO BARGAIN AT ALL!

In these times of mounting production costs, many purchasers of industrial supplies and materials are beginning to look upon their distributors as an extra expense. At first blush, it might *seem* cheaper to buy direct from the maker.

Actually, the distributor helps *both* the buyer and manufacturer save money. Like this:

He saves the buyer warehousing, handling and storage details, paperwork, provides an immediate single source of supply for thousands of items that industry needs, often in a hurry.

He saves the manufacturer the cost of heavy inventory maintenance in all parts of the country, the expense of an army of salesmen, a fleet of trains and trucks, and a staff of credit and collection experts. In a sense, your distributor represents a cooperative distribution facility that you share with all other firms in your area.

Next time you're tempted to get a direct quotation from the manufacturer, whether on a big or small item, figure out *all* the costs—not just the first cost—and you'll find you gain much more, yet in the long run pay no more, by utilizing the services of your distributor.

WICKWIRE ROPE

3151

A PRODUCT OF THE COLORADO FUEL AND IRON CORPORATION

General Cable Expands

Additional facilities in Illinois, Rhode Island and Canada will boost wire and cable supply

GENERAL CABLE CORP., New York, has launched a major expansion of manufacturing facilities to meet the growing needs for electrical and communications wire and cable. It acquired a 100,000-sq-ft plant, is building a plant in Illinois and is co-operating with Canadian and British interests to create a new company.

Providence Plant—Swiftest results in the program are being realized by the acquisition of General Insulated Wire Works Inc., Providence, R. I., maker of telephone wires, power supply cords and cord sets. C. J. Craig, president of the firm, will be appointed vice president of General Cable, with chief responsibility for the Providence operation.

Illinois Project — By November, a 50,000-sq-ft plant will be completed in Monticello, Ill., and will be in full operation by the year end. It will produce paper telephone cable at first and will be expanded later. This facility will increase General Cable's production of this type cable by about 25 per cent. R. E. Riggin, assistant plant manager at the firm's St. Louis factory, will take over the management of the Illinois plant.

Canadian Firm — Telecables & Wires Ltd. has been formed as a joint venture of Canada Wire & Cable Co. Ltd., Telegraph Construction & Maintenance Co. Ltd. and General Cable Corp. It will manufacture a complete line of telephone wires and cables in a plant to be built in or near Winnipeg, Man.

Officers of the Canadian company are: Chairman of the board, J. R. Bradfield, president of Canada Wire & Cable and executive vice president of Noranda Mines Ltd.; vice chairman, I. T. Bennett, chairman of the board, General Cable Corp.; president, O. W. Titus; vice presidents, J. R. MacDonald and L. G. Lumbers.

Buys Hydraulic Equipment Firm

American Brake Shoe Co., New York, purchased Denison Engineering Co., Columbus, O., manufacturer of hydraulic presses, pumps and automatic controls. The property will be operated as a wholly owned subsidiary, with W. C. Denison continuing as president and chief executive officer. American Brake Shoe recently embarked upon a broad diversification program and has expanded its research activities in the development of new products.

Stauffer Chemical To Build

Stauffer Chemical Co., New York, plans to build a multimillion dollar plant for the production of carbon bisulphide at Mobile, Ala.

Fastener Firm Changes Hands

Southco Division, South Chester Corp., Lester, Pa., purchased the working assets of Lion Fastener Inc., Honeoye Falls, N. Y. Southco designs and makes industrial fastening devices.

Foundry Placed on Stand-by

The Pittsburg, Calif., Ordnance Steel Foundry (formerly designated Columbia Steel Foundry) will be kept in readiness under terms of an Army-Ordnance contract awarded to U. S. Steel Corp.'s Columbia-Geneva Steel Division, San Francisco. The division will provide labor, services and equipment to lay away the foundry and its machinery. Restored at a cost of $6.5 million for government manufacture of armor steel hull castings during the Korean War, the foundry will be able to resume production on short notice.

Scrap Broker Opens Branch

David J. Joseph Co., Cincinnati, opened an office in Gateway Center, Pittsburgh, under the management of J. D. Lieberman. The firm is a national broker of iron and steel scrap.

Newport Steel Expanding Mill

Newport Steel Corp., Newport, Ky., is constructing two ingot preheating furnaces. They're for the Wilder, Ky., plant section housing its new reversing hot strip mill. The facilities will complement the six circular soaking pits which service the hot rolling operation. Robert E. Harvey is executive vice president and general manager.

Hoffman Machinery Buys Firm

United States Hoffman Machinery Corp., New York, purchased Intercontinental Mfg. Co. Inc., Dallas, manufacturer of aircraft components, tractors, farm implements, busses, motor coaches, industrial equipment and machinery. The firm operates plants in Garland and Brady, Tex. U. S. Hoffman makes textile maintenance equipment, pneumatic conveying systems, centrifugal blowers and exhausters, oil filtration units, metal finishing and ordnance equipment. It operates several ordnance plants.

American Brass Builds Plant

American Brass Co., Waterbury, Conn., is erecting a $2.5-million plant at Mattoon, Ill., for the manufacture of flexible metal hose and tubing. A. B. Freeman is vice president in charge of the company's American Metal Hose Division. R. C. Donovan will manage the Mattoon unit, scheduled for operation in January, 1956.

Parts Maker Adds New Line

Teer, Wickwire & Co., Jackson, Mich., purchased Lindberg Air & Hydraulic Cylinder Division from Lindberg Engineering Co., Chicago. The new operation will be set up as Lindberg Air & Hydraulic Division of the Jackson firm, manufacturer of machined parts primarily for the automotive industry.

McKee Celebrates 50th Year

Arthur G. McKee & Co., Cleveland, will celebrate its 50 years of service to the steel industry this fall. Having a hand in the building of many of the nation's steel plants, its services include engineering, purchasing, construction and operation of steel mills. It also has a consulting service.

Since 1926, when it merged with Widdell Engineering Co., it has performed similar services for the petroleum, petro-chemical and chemical industries. H. E. Widdell has

been president of McKee since 1946.

Ford Expands Ohio Facilities

Ford Motor Co., Dearborn, Mich., plans major expansion of its Walton Hills and Brook Park, O., plants at a cost unofficially estimated at $12 million. The company also will build a plant at Sharonville, O., for the production of automatic transmissions.

At the Walton Hills stamping plant, a 215,000-sq-ft addition (for storage) will enlarge that facility to 1.5 million sq ft.

At Brook Park, 300,000 sq ft of manufacturing space will be added to the present 562,000 sq ft of engine plant No. 2. The foundry will be increased by 70,000 sq ft. Six-cylinder engine production will be moved to the No. 2 plant. Plant No. 1 will be devoted to production of V-8 engines and plant No. 2 will continue making them. The plant addition will increase V-8 production capacity by 50 per cent.

The enlarged foundry will supply all castings for the two Brook Park engine plants and a portion of those used at the new plant at Lima, O.

The Walton Hills and Brook Park additions are part of a recently announced $625-million company-wide expansion program.

The Sharonville plant will be used in conjunction with the Automatic Transmission Division's facility on Red Bank road, Fairfax village, a suburb of Cincinnati. Both operations will be under the direction of John Lawson, manager of the Fairfax plant. The division's headquarters are in Livonia, Mich., where it also operates a manufacturing plant which is undergoing expansion.

Steel Container Plant Opened

United States Steel Products Division, United States Steel Corp., Pittsburgh, is fabricating steel containers at its new plant in Pennsauken township, near Camden, N. J. It will produce steel drums and pails for the petroleum, chemical, paint, food and other industries in the eastern seaboard area. Containers will range from 3.5 to 7-gal pails to 120-lb grease drums and 55-gal oil drums. Annual capacity is scheduled to be 2,379,000 drums and 3,200,000 pails, with 55-gal drums accounting for the largest tonnage. E. A. King is district sales manager, and C. I. Gibson is superintendent of the new plant.

Trailer Maker Plans To Build

International Trailer Co. Inc., Baltimore, manufacturer of custom trailers, will build a plant, containing 35,000 sq ft, on the Pulaski Highway.

Greist Buys Air-Marine Motors

Air - Marine Motors Inc. of Amityville, N. Y., and Los Angeles, has been acquired by Greist Mfg. Co., New Haven, Conn. Air-Marine makes fractional horsepower motors, fans and blowers. Its new officers are: D. H. Thomas, president; H. M. Greist, executive vice president; M. D. Vanderbilt, treasurer; J. B. Wolff Jr., vice president and assistant treasurer; H. G. Dowd, secretary. Greist Mfg. makes sewing machine attachments, photographic equipment and other precision products.

NEW ADDRESSES

Universal Electronics Co., manufacturer of electronic products, moved to 1720 22nd St., Santa Monica, Calif.

Wilton Tool Mfg. Co. Inc. moved into its new general office and factory building at 9525 Irving Park Road, Schiller Park, Ill.

Chicago Tramrail Corp. recently completed its office and service building at 1330 S. Kostner Ave., Chicago 23, Ill.

Acme Metal Spinning Co. moved into its new building at 2100 S. 57th St., West Allis, Wis.

Oswald Refractories Co. Inc. moved to larger quarters at 1617 S. Brentwood Blvd., St. Louis 17, Mo.

Salem-Brosius Inc. is in its new office building at Carnegie, Pa. Its mailing address, P. O. Box 2222, Pittsburgh 30, Pa., will reach George J. Hagan Division, Phillips Division, Hyla Process, as well as the parent firm.

ASSOCIATIONS

New companies elected to membership by the **National Screw Machine Products Association**, Cleveland, are: Abbott Products Inc., Whitestone, N. Y.; Columbus Jack Corp., Columbus, O.; Economy Machine Products Co., Chicago; Mantel Screw Products Co., Milwaukee; Naugatuck Automatics Inc., Naugatuck, Conn.; Nutmeg Screw Machine Products Co., Wolcott, Conn.; Owen Mfg. Inc., Litchfield, Ill.

New companies and their representatives elected to membership in the **Investment Casting Institute**, Chicago, are: Brace Inc., C. H. Brace, Minneapolis; Illinois Precise Casting Co., R. J. Harvey, Chicago; Industrial Fine Castings Ltd., T. W. Morewood, Toronto, Ont.; A. P. Green Fire Brick Co., K. K. Breit, Mexico, Mo.

George F. Groff, Crucible Steel Co. of America, Pittsburgh, and E. B. Lee Jr., Latrobe Steel Co., Latrobe, Pa., were elected to membership in the **Controllers Institute of America**, New York.

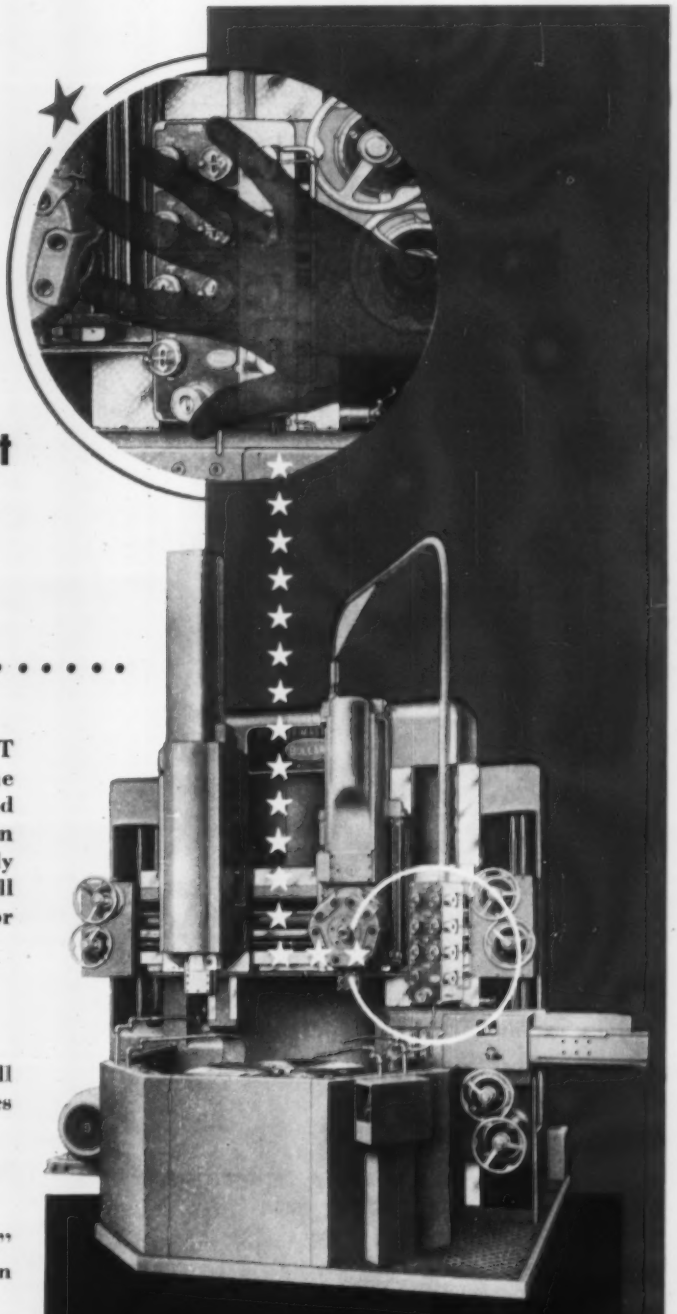
Detroit Steel Products Co., Detroit, has been accepted for membership in the **Building Research Institute**, Washington. The company makes metal windows, doors, panels and roof decks. The institute is a part of the Division of Engineering & Industrial Research, National Academy of Sciences-National Research Council.

REPRESENTATIVES

Industrial Division, R. D. Werner Co. Inc., Greenville, Pa., appointed Carl A. Underhill & Co., Detroit, sales representatives for Ohio, Indiana, Illinois and Wisconsin. The company makes custom aluminum extrusions and roll-formed shapes in aluminum, stainless steel, carbon steel and other metals.

Within the Span of a Man's Hand

The power to transmit the commands of the operator *to the machine* . . . . . .



By means of the movable PENDANT CONTROL the start and stop of the spindle; selection of speeds, feeds and directional movements of all heads in feed or traverse are quickly and easily accomplished. Interlocks and a stopall stick provide safety for both operator and machine.

Additional features include:

SCREW FEED

for vertical and horizontal motion of all heads — to assure fine smooth finishes with greater accuracy.

POWER INDEXED MAIN TURRET (optional)

Five sided turret for "run of the mill" jobs. Four sided turret for production jobs.

right in tune

..and REX is the standard by which all other high speed steels are compared

A tuning fork sounds the *standard pitch* to which musical instruments are compared. There's a recognized standard for high speed steels, too — Crucible REX®.

But don't take our word for it. Try REX in your own shop. Compare its structure, finish, hardenability, carbide distribution and general uniformity. Measure the *extra performance* you get. You'll see for yourself why no other tool steel outperforms REX . . . why it's the *standard for comparison* wherever high speed steels are used.

Next time you buy tool steels, be sure of top performance — specify REX. Remember, it's made only by Crucible — and is available from local warehouse stocks, or by prompt mill delivery. *Crucible Steel Company of America, Henry W. Oliver Building, Pittsburgh 22, Pa.*

Technical Outlook

PLATING TREND—As evidenced at the Industrial Finishing Exposition (Cleveland, June 20-23) the drive is on to bring automatic handling methods within reach of about every plating shop. Equipment builders say there's a large, almost untapped, potential in automatic equipment for the smaller shop. Machines that load and unload racks are getting into the automation picture. A few already are in operation.

HIGH HEAT PLATE—The American Electroplaters' Society met in Cleveland at the same time. R. W. Moeller, Pratt & Whitney Aircraft Co., told them that a nickel-cadmium diffused plate is being used to protect intricately shaped low alloy steel parts operating in jet engines up to 1000°F. To produce the corrosion resistant coating, parts are plated with 0.0003-in. nickel, followed by 0.0001-in. cadmium, then heated at 630°F for one hour.

RECTIFIERS ROLLING—All the germanium rectifiers displayed at the finishing show bear out a trend STEEL reported earlier ("Revolution in Rectifiers," Mar. 21, page 116). One company alone reports 6000 kw of germanium rectifiers installed and 5000 kw on order. A 600-kw installation for a 250-volt factory power supply is well beyond the talking stage.

ALUMINUM RIDE—Your automobile tires soon may contain aluminum yarn to cool the tread. The metal has excellent heat-dispersal qualities.

HOT RACE—Running neck and neck in the race toward materials combining strength with oxidation resistance at high temperatures are cermets and coated molybdenum. We'll lick the brittleness of cermets, but we may get a satisfactory coating for molybdenum first, says Dr. Paul Schwarzkopf, president of American Electro Metal Corp. At the same time he pointed to development by his company of a method for coating large surfaces with cermets that gets these materials out of the pressed powder category.

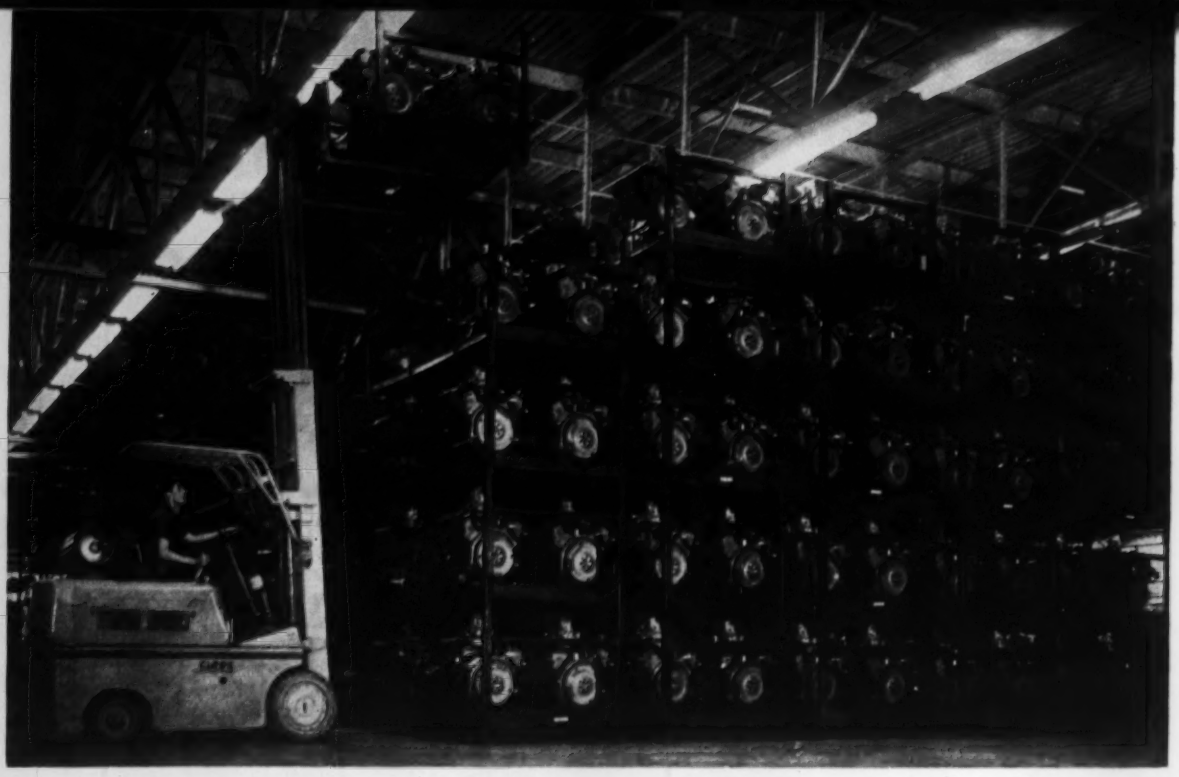
TWO ROADS—Some precision casting problems may be solved by making small investment heats under a protective atmosphere. Melting stock which has been vacuum refined is used. For other alloys, best results are obtained only if either the investment heat is under vacuum or if refining and casting are done in one heat. That's what James H. Moore, general manager, Vacuum Metals Corp., Syracuse, N. Y., told the Investment Casting Institute in New York.

STRONGER MOLY—R. I. Jaffee, chief of Battelle's nonferrous physical metallurgy division, reports a method that gives greater hot strength to molybdenum up to 2000° F. Rupture strength at 1800° F is increased three to four-fold by dispersion of small amounts of suitable oxides (such as ZrO_2). Powder metallurgy technique is used.

BETTER TITANIUM—A new titanium alloy—tensile strength, 65,000 to 85,000 psi—uses aluminum in place of oxygen as a strengthener. A powder metal product, its advantages lie in improved impact strength (40 to 50 ft lb at room temperature) and a notched fatigue endurance ratio in the range of 28 to 32 per cent at 10 million cycles, says Clevite Corp.'s Brush Laboratories Division.

SAFETY SLEUTH—An indicator, about the size of a fountain pen, senses explosive gas. Its bulb glows dimly until contact is made with an explosive atmosphere. Then it blinks. The rate of blinking corresponds to the concentration of combustibles.

Metalworking Outlook—p. 29 Market Outlook—p. 99



BETTER MATERIALS HANDLING—1

Setting the Stage for Efficiency

By BYRON E. KENNEL
Assistant Editor

FORD planned its production layout. Then a building was fitted around it. The product, a new Louisville plant, is described as a single integrated machine. Plant and equipment work together.

The principles apply to any metalworking plant. A lot of research on plant layout and materials handling equipment was done by Ford to get the best design for new assembly plants at San Jose, Calif., Mahwah, N. J., and Louisville.

This article is the first of four which will present the highlights of Ford's research and experience as exemplified by the Louisville plant.

$$$$—A lot of dollars go for materials handling. Costs average 30 per cent of the production dollar; in some plants they hit 85 per cent, says Conveyor Equipment Manufacturers Association. On the average, 50 tons of material must be moved to produce 1 ton of product.

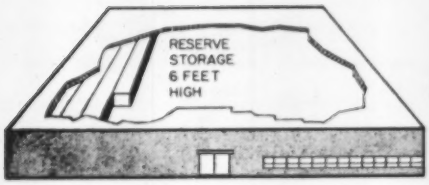
The most expensive dollar you may ever spend is the one that buys the wrong handling apparatus. A fresh look at basic ideas is needed—new equipment changes the use of fundamentals.

Where To Start—Materials handling methods should determine the design of plant facilities. Once a plant is up, it will influence the choice of handling equipment.

The volume and nature of the product determine the productive machines. The arrangement of the productive process depends upon the equipment selected to move materials. The flow of materials is the core of plant layout.

This is the first of a series of articles on better materials handling. Following articles will cover module units, storage and receiving and the lift truck-tow train team. Extra copies of each article are available in quantities of one to three until the supply is exhausted. Write Editorial Department, STEEL, Penton Bldg., Cleveland 13, O.

Save Money . . . Stack 'em High



(A) 2,047,284 sq ft

(B) 1,383,300 sq ft

Building A requires 663,984 additional sq ft to store the same amount of material as B. Additional building cost—over $6 million.*

*Estimated by STEEL

Ford's new Louisville plant is represented by B. Building size was held down by using tier racks and taking full advantage of the 18-ft air space for reserve storage. If stock were stored only to the average man's reach, the building (as at A) would have to be almost 50 per cent larger.

Planning the handling system must be done along with planning for equipment, facility and stock placement to get a smooth flow of materials and an economical balance between manpower and equipment.

Do's and Don'ts—Determine the space needed for plant operation after production tools are selected. Don't set aside space for storage until you know how much space you need. Figure rail and truck unloading needs from the material shipments that will come in. Lay out main aisles after the materials handling system is chosen.

At Ford in Louisville, 85 per cent of shipments come by rail, 15 per cent by truck. The number of unloading spots needed was estimated by charting the volume of material received by rail. A standard car unloading time, plus 4 hours for switching, was used. The number of unloading spots needed determines the length of the unloading dock.

Proper distribution of heavy unloading spots along the dock will give a straight line flow from unloading to storage to use point. To do this you must determine the volume of material movement from the rail dock to each department. Elimination of aisle bottlenecks and crosstravel on the unloading dock is a vital factor in efficient plant operation.

Dimensions—A minimum dock width of 30 ft was established by the traffic pattern and operations required on the Louisville dock. This provides 15 ft of working space for unloading and a 15-ft traffic aisle.

A rail spot study will indicate the location, length of travel and number of bridge and bay cranes.

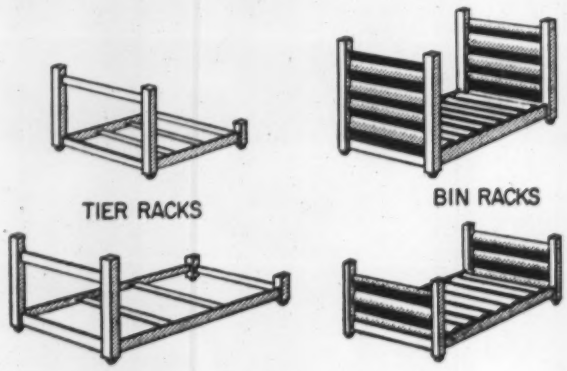
For Trucks — A similar study gave the number of spots and the type of unloading platform needed. In locating the truck dock, the shortest average flow of materials for the majority of parts is the goal. However, this flow must be studied in relation to the flow from the rail receiving dock to make sure no interference points are created.

Dock facilities, size of dock, dockboards and height of dock must be planned for fork truck

Check List for Management

1. **To get a clean and orderly plant—demand it from supervision.**
2. **Encourage use of recommended materials handling methods.**
3. **Enforce proper use of materials handling equipment.**
4. **Make an occasional systematic review of the zoning of foremen and equipment, Workloads change.**
5. **Help the complainer solve his own problems.**

All parts, 9000 of them, at Louisville are stored and handled in racks and module units. Next week's issue of STEEL will describe the latter.



movement. At Louisville, 4000 and 6000-lb fork trucks do the unloading.

The trailer train is well adapted to planned unloading methods. Its use affects production layout and stock placement. Main aisles should be 15 ft wide, aisles through which materials move should be at least 12 ft wide.

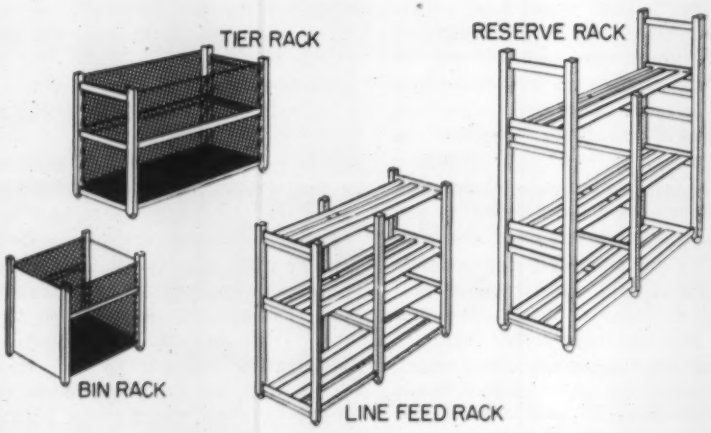
At Louisville, receiving and unloading docks require 13.5 per cent of the total floor space; aisles, 18.7 per cent; storage, 17 per cent.

About 7 miles of conveyors are in use. Where fluctuating stock floats and the frequency of layout changes place an economic barrier on using fixed storage conveyors, tier racks are used. They conform to the unloading and movement pattern and afford versatility and flexibility.

Five Factors — Determining stock storage space are: Production schedules, receiving quantities, shipping containers, material floats and ceiling heights. At Louisville, Ford had to learn the physical characteristics and assembly sequence of 9000 parts. A storage container is assigned to each part.

Stock storage space in the plant is divided into two categories—reserve and line feed.

Wire - enclosed tier rack provides a container for bulky items. The wire-enclosed bin holds small dense parts. Semipermanent racks replace the multitude of odd-sized, angle-iron racks usually found in a plant.



Line feed storage is material accessible to the production operator; reserve storage is material that must be brought to him.

Rules of Thumb—Minimum area requirements for line feeding are: For unit loaded material, carry the minimum of a 4-hour supply of each part. For hand handled material carry at least an 8-hour supply. Most practical line feed storage depth is 10 ft. When it is impractical to have 4 hours of stock next to the production line, a special line feed backup area may be created nearby.

Reserve areas vary in depth and length; full utilization of air space is basic in planning reserve storage area requirements.

The key to mass production is efficient mass movement of material. Fork trucks, tow tractors, pallet trucks and grip couplers form the backbone of the mechanized equipment at Louisville. Each has its own design characteristics. Only in performing intended functions is the top efficiency of equipment gained.

Versatility of the walking type, grip coupler has been increased by modifying the design to permit the operator to ride. It pays off in increased efficiency where there is continual movement of from 50 to 100 ft.

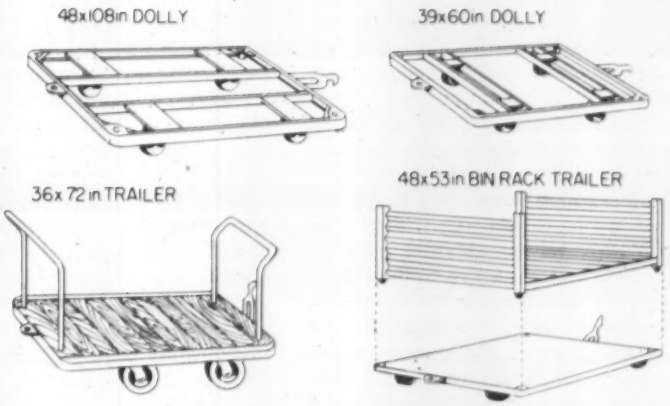
Ford's Selection—At Louisville, fork trucks that stack right up to the 18 ft trusses are used. Ford selected lift trucks powered by liquid petroleum gas. A low mast truck for highway trailer unloading saves time and, combined with the trailer train, makes a good team for keeping unloading docks clear.

Standard times applied to the unloading, storing and line feeding of material by fork truck give the number of trucks needed. A detailed study of the movement of material down each aisle will establish the quantity of rolling equipment and aisle width required for servicing each department.

A helpful addition to rolling equipment is a solid deck bin rack trailer. It handles a bin rack with a capacity load and also makes an excellent carrier for heavy 48 x 48 in. expendable pallets that have a tendency to break on a 36 x 72 in. general-purpose trailer.

"Materials handling is one of the most lucrative areas for cost reduction," says D. S. Harder, vice president-manufacturing, Ford Motor Co.

"Human muscle costs $10 per horsepower-hour. Electricity is 4 cents or less," states R. C. Sollenberger, executive vice president, Conveyor Equipment Mfrs. Assn.



Trailer trains move 3150 tons each day

MACHINING . . . 1955

DRILLING and BORING

This is the fourth in a series of articles on Machining . . . 1955. The first three covered turning, milling and forming. Others will be on planing and grinding.

SO FAR, drilling has been unable to get on the carbide band wagon —the tool material that has enhanced all of drilling's sister machining operations.

Forced to meet the same challenge (faster production), drilling has had to turn to other quarters.

The Answer—Here, production must be jumped by easier handling, more automatic functions, more multiple drill heads, improved fixtures and redesigned machines that hold down time to a minimum.

On both the standard drilling machines and those built for special-purpose high-production work, this often means that more of the responsibility for the operation is being assigned to the machine, less to the operator.

Radials — The horsepower and rigidity of radials have been upped to insure better performance at the drill point. New models have speed and feed preselectors to further cut manipulation time. Automatic positioning tables improve the cycle times on radial jobs.

Many functions of the radial are now powered, many pushbutton operated. New radials, with inbuilt accuracy, can do a surprisingly good job on tight-tolerance boring jobs.

Speeds—While drill speeds have not changed significantly, available speeds on machines have. Builders are offering a wider selection of speeds. You have a better chance of getting the speed for any drill operation that gives peak drill performance and life.

Double Duty—In putting more automatic handling, work locating and controls to work, machine builders and users are caught between two trends. One is to give the machine the shortest possible cycle to get peak production. This spells single-purpose, highly automatic machines.

The other trend is toward more versatile machines that can adapt to new parts or to redesigned parts without leading the user into excessive conversion costs.

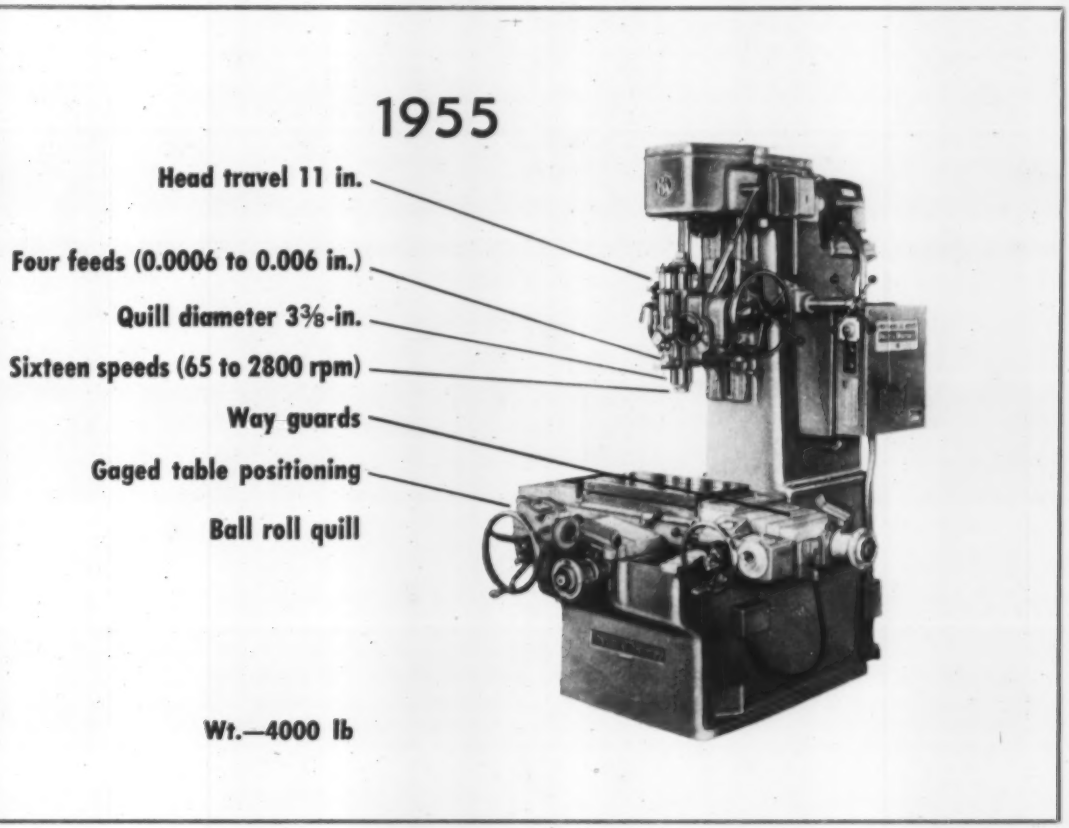
As one builder puts it: "We must be sure that our machines can be put on a brand new job with not more than a 15 to 20 per cent loss of equipment."

Another builder, pointing up the importance of versatility, emphasizes that a minor change in part design can cost the user thousands of dollars in new equipment. This, he feels, must be considered in the purchase of new equipment.

On the Spot—Another important trend in drilling has new machines positioning the workpiece automatically. Positioning devices take advantage of precision gages and automatic table feeds. They reduce set-up time to a fraction of what it is with hand positioning. At the same time, they reduce the complicated tooling and fixtures to a minimum.

Quick-change and preset tools are musts for many high-production drilling jobs. These, too, reduce down time, keep the machine at work.

Boring—Drilling and boring are subject to about the same trends. There's one important difference: Boring has been able to capitalize



on the high-speed potential of carbide cutting tools.

Better cutting tools, plus greater rigidity of the machines, has boosted potential speeds by as much as 100 per cent on some jobs.

No Sweat—On boring equipment too, the nonwork part of the cycle has been sliced. One new jig borer has 95 per cent of its functions controlled by pushbuttons. This includes all the feed and speed changes, clamping, rapid traverse and positioning to plus or minus 0.0001 in.

This substitutes for tedious and time-consuming hand manipulation by the operator — reduces the chance for operator error.

Versatility—Almost all the dozen makers of boring machines contacted recently by STEEL cited versatility of equipment as one of the most important trends in their field. One said the development of this type equipment constituted his "biggest single challenge."

A Heald precision boring machine, for example, performs 109 finishing operations on nine different aircraft instrument parts. This is done with 27 different tool blocks. Operations include boring, chamfering, plunge facing and generated facing.

Idea Source—Full-scale automation is playing a big part in the development of new ideas for both drilling and boring. One new machine works on two different, but similar parts without any operator adjustment. Probes on each head detect which of the two parts is in position; then tell the head whether it is to operate.

Another new machine, unannounced, is controlled electronically. It has two telephone dials which are used to establish the position of the tools.

Feed Back—The principle of letting the performance of the machine control its cycle will become even more common. To maintain peak production and, at the same time, keep close check on tolerances, automatic gaging checks completed parts and feeds back information to the machine.

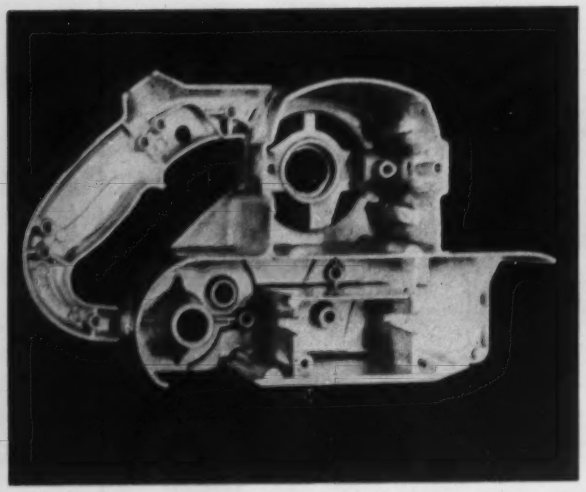
This information can be used to adjust tool settings. It can be used to stop the machine after a given number of cycles if work is still out of tolerance.

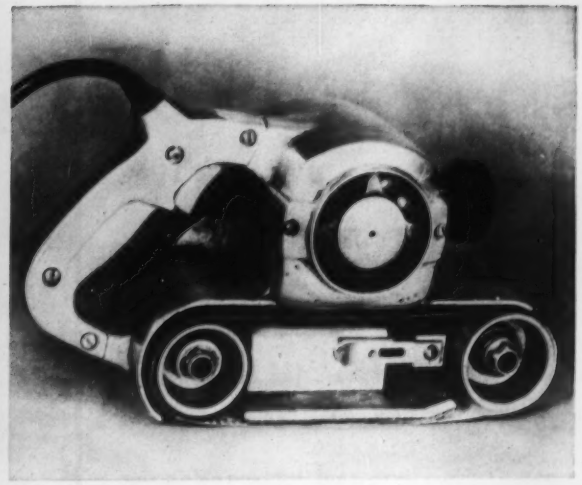
Metal Saver — Trepanning has made a sizable dent in the drilling field. The operation takes full advantage of carbide cutting; it also leaves a core of metal that can be used.

Trepanning has a practical limit on hole size—roughly 1½-in. in diameter. Smaller holes should be drilled.

Carbide's Future — Carbide-tipped twist drills work on cast iron, cast steel and nonferrous metals. So far, they have not been able to tackle steel.

The problem is inherent in drilling: The cutting speed at the center of a twist drill approaches zero surface feet. It becomes less a matter of cutting metal, more a matter of burnishing. With high stress and no cutting at that point, carbides don't fill the bill. Many innovations have been tried, but there seems to be little that can be done to overcome all problems.

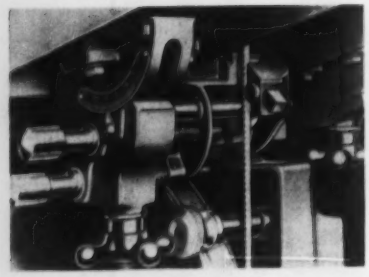




Key to the light weight of this power belt sander (right) is its diecast aluminum housing (left), a combination handle, motor housing and belt frame

DIECASTINGS:

Natural for Home Tools



Under-the-table view of this power band saw shows diecast zinc trunnions, control handles and bracket mounted between trunnions on the machine's main frame

INDUSTRIAL TOOLS must meet critical specifications to maintain a heavy work schedule. But the machines are handled by skilled operators and have the advantage of continuing maintenance programs.

The do-it-yourself workshop operator—semiskilled or unskilled—may ignore preventive maintenance of a machine and subject it to unpredictable abuses. In addition, the home workshop operator wants a lightweight tool.

How—Recognizing this, designers are incorporating zinc and aluminum diecast parts in many of the new models of machine tools for home and factory. The parts have high impact and tensile strength, are cast to close tolerances, are light and have an attractive appearance.

Manufacturers find, too, that one-piece construction, inherent in the diecasting process, is saving them production and assembly costs.

Power Belt Sander—A 3-in. belt sander, made by Porter-Cable Machine Co., Syracuse, N. Y., duplicates many of the features of heavier industrial equipment, yet weighs only 10 lb. A diecast, 380-aluminum-alloy housing serves as handle, motor housing and belt frame. Thin walls separate each section of the one-piece casting, which is cored for assembly of the motor, bearings, gearing, switches, drive linkage and wiring.

By specifying a diecast housing, the company eliminated machining operations required in other production techniques. This cut in production costs enables Porter-Cable to offer the home workshop enthusiast a full-size belt sander at a moderate price.

Band Saw—A 14-in., wood-cutting band saw, made by Delta Power Tool Division, Rockwell Mfg. Co., Pittsburgh, utilizes zinc diecast trunnions, handles and bracket.

The saw's work table is adjustable, tilting 45 degrees right and 10 degrees left, with a positive stop at the level position. Two diecast trunnions make this adjustment. A diecast handle is attached to each trunnion's controlshaft. Also part of the adjusting mechanism is a diecast bracket, mounted between the trunnions on the machine's main frame.

For Accuracy—For blade control, Delta uses two diecast blade guides. This insures upper and lower blade support for accurate work while allowing the blade to run free.

In addition to these components, a one-piece, diecast lamp shade is used on this machine and other Delta equipment. These castings are of high-purity zinc alloy (ASTM AG-40A, SAE 903, Federal Spec. QQZ-363A).

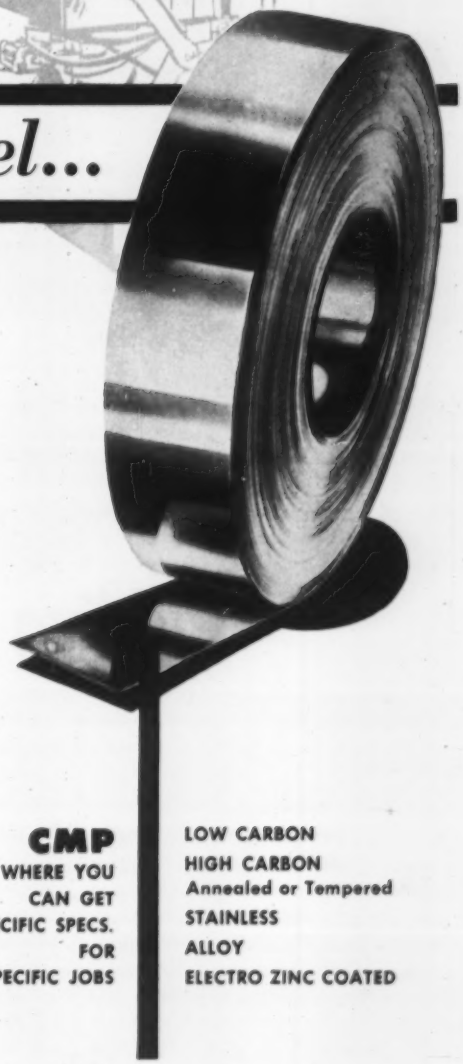
CMP

cold rolled strip steel...



can help reduce your manual costs!

CMP's precision processing methods hold oversize width and gauge variations within exceedingly close limits (even as fine as 5″ ± .003″ x .067″ ± .001″ if required), resulting in . . .

. . . top parts yield per ton . . . more feet per coil . . . fewer production interruptions for coil replacement on automatic feed operations.

. . . less wear on dies . . . fewer die changes and "regrinds."

. . . easier fitting and assembly . . . fewer "oversize" rejects . . . less tedious "resizing" to make oversize parts fit.

More important . . . in many cases, CMP Cold Rolled Strip Steel can be processed to restricted physical specifications to facilitate, consolidate or even eliminate labor-consuming production operations and handling. Often, a simple specification change can do as much or more to reduce manual costs than expensive new equipment.

A qualified CMP representative will be pleased to check your flat-rolled material specifications and fabricating processes with a view to developing restricted specifications that will cut your end-product costs.

Monel hooks and straight through system add up to . . .

Pickling at Half the Cost

By GEORGE S. SHEPHARD
Chief Engineer
Pittsburgh Screw & Bolt Corp.
Pittsburgh

A NEW pickling line at the Pittsburgh plant, Pittsburgh Screw and Bolt Corp., reduces man-hours per ton by 80 per cent and increases production 30 per cent.

The plant, one of the world's largest for making bolts, nuts and rivets, has a single-shift production capacity of 3000 tons a month.

No Changeover Loss—The new pickling line was put in during a two-week vacation period. With one shakedown run on a Sunday morning, it was open for work the next morning.

Mostly coil and bar stock are pickled — the company handles about 75 per cent more coil than bar stock. Ten huge pickling hooks, believed to be the largest, carry coils through the operation.

They're Big — Each hook is 18 ft long, with the usable part measuring 13 ft. The header support at the top is an iron pipe with two ship-channel stiffeners. Hooks weigh 2900 lb each, 1000 lb of it being Monel. Work load is 6000 lb each. Under full load the hook deflection is only 2 in., header deflection ½-in.

The line has three coil tanks (where hooks are used) and two bar tanks. Eventually, bar tanks are expected to be eliminated, and perhaps more coil tanks will be put in. Tanks are 15 ft long, 10 ft wide and 7 ft deep. The liquid level is kept at 6 ft, and each tank will hold two of the Monel hooks, each bearing 6000 lb of coil.

Old Way—The only alloy used was in the chain that was looped through coils. Capacity was only 200 tons per day, and it took three men—two chain handlers and a crane operator. The new system

Westinghouse announces . . .

New induction heater designed for easier conversion

Building-block design of the new Westinghouse 30-kw induction heater permits 32 regular combinations for your low-power applications, plus a number of special arrangements. It provides the kind of flexibility and convenience you need to keep abreast of your constantly changing production setups.

Versatile—you get custom-built installation of standardized equipment to handle a wide range of applications. Unit ideal for hardening, annealing, brazing or soldering.

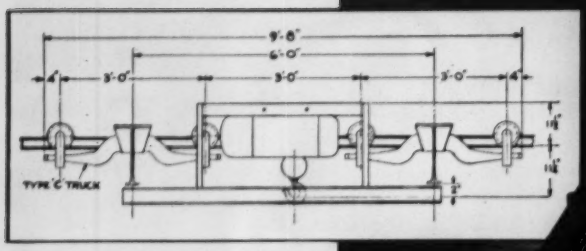
Easy to Use—front of worktable, free of controls, can be used for mounting work-handling equipment. Instruments at eye level for easy readability. M-G set readily accessible without removing panels. Buy the equipment you want, adapt it when your needs change: single to two-station operation—sink to bench top—high-voltage to low-voltage output—grouped as a compact unit to remotely located output stations.

Equipment consists of four basic units: (1) 30-kw, water-cooled, 10,000-cycle M-G set, (2) generator control cabinet, (3) high-frequency output cabinet, (4) work table.

For more information about improving your induction heating operations, call *The Man With The Facts*—your Westinghouse sales engineer. Ask him for your copy of booklet B-6519, or write Westinghouse Electric Corporation, 3 Gateway Center, Pittsburgh 30, Pa. J-02297

YOU CAN BE SURE...IF IT'S

Westinghouse



Lifting this three-ton condenser and moving it about is made an easy one-man job with the Tramrail crane.

HIGH LIFT UNDER LOW ROOF *Solves Handling Problem*

A double-girder, high-lift Cleveland Tramrail crane proved the solution of a handling problem at The Refrigeration Engineering Co., Los Angeles, Calif., manufacturers of evaporators and condensers of all sizes up to 100-ton rating.

Because many of their units are high and heavy, and the roof is very low, it was necessary to develop a special crane design that permits utilizing space between the crane girders. How well this was engineered is evidenced by the fact that while the distance from floor to the low part of the roof truss is only 11'-10¼", the hoist hook can be raised 10'-0" above the floor.

The crane and hoist are motor-driven, push-button controlled. The trolley is hand-propelled. The hoist has a capacity of three tons and travels at 18 feet per minute.

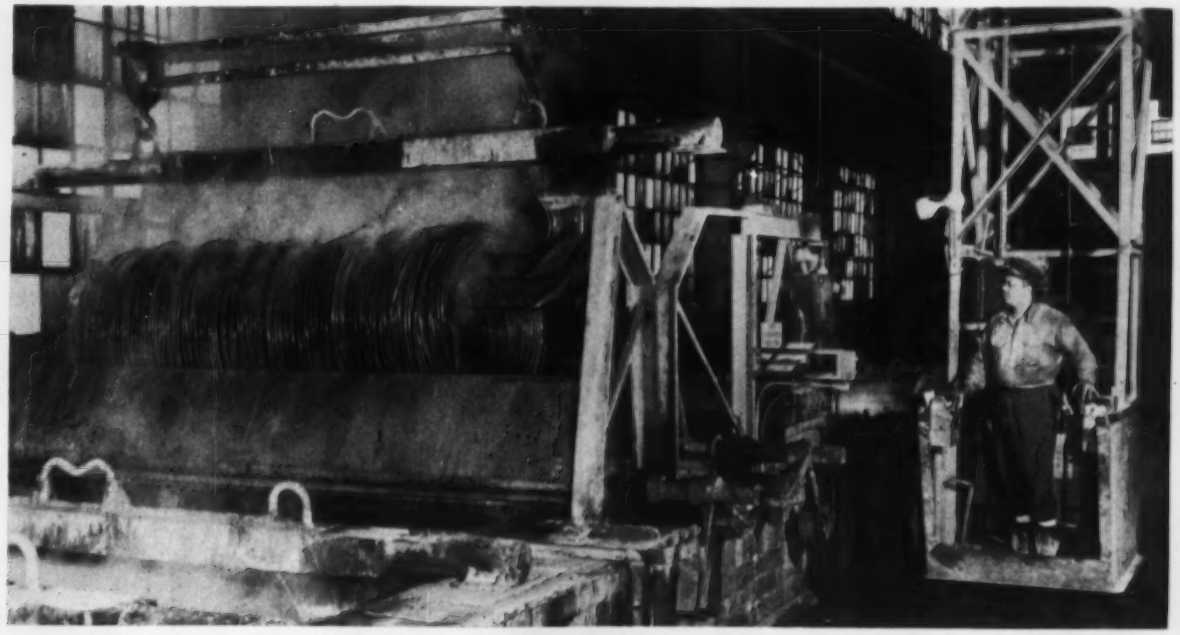
CLEVELAND TRAMRAIL
OVERHEAD MATERIALS HANDLING EQUIPMENT



Crane operator has excellent vision for moving loaded hairpin hooks anywhere on the line. Left foreground shows two hook loads in acid

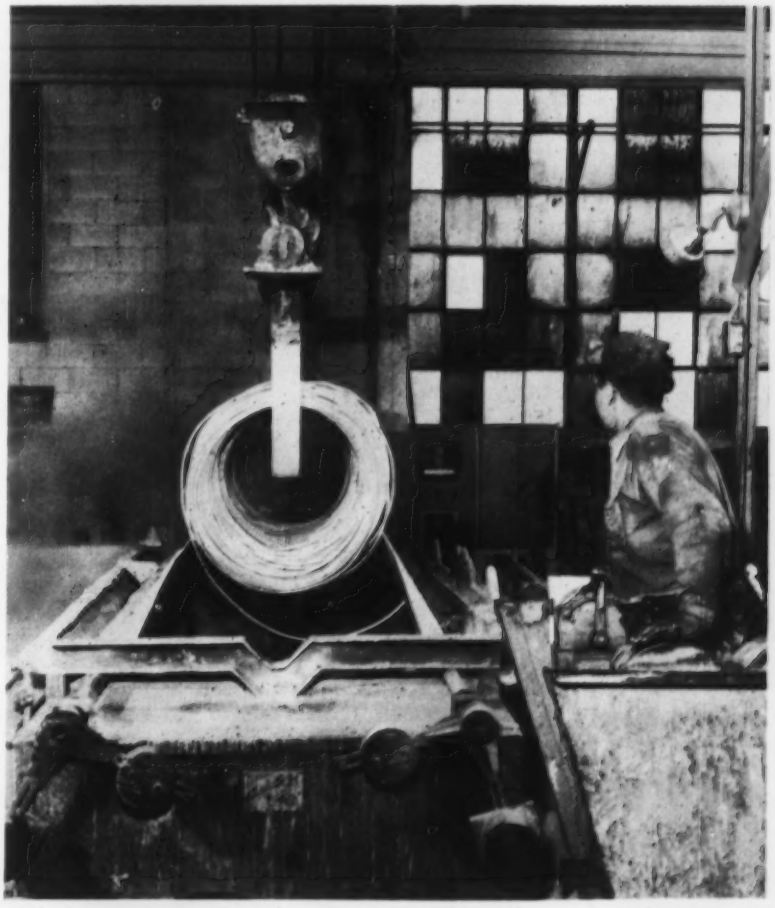
calls for only a crane operator.

Higher operation and maintenance costs were the main disadvantages of the old system. Extra man-hours were tied up in inferior materials handling. Production schedules were not met, and there was considerable downgrading of product.

New Cycle—Two 6000-lb loads of coils go through every 30 minutes, progressing through acid bath, rinse, lime dip and baking steps. This means 6 tons an hour, or a possible capacity of 264 tons a day. Each Monel hook is suspended in the acid solution about three times each day.

The hooks are subjected to an 8 to 10 per cent sulphuric acid solution at pickling temperatures of 180 to 185°F. Their life expectancy is well over five years. After nearly two years of constant use, there is no sign of deterioration. Other than routine inspection, no maintenance has been required.

Aside from cutting pickling costs in half and increasing production 30 per cent, product quality has been upgraded. There is less damage from handling since the coils are never removed from the pickling hook from the time they leave the raw materials section until pickling is completed.



Last step in the line is a 5-minute bake to thoroughly dry the lime coating. The same Monel hook carries this load through the entire line

Accident studies show that . . .

Hands Are Safer in Gloves

DO YOU know that work gloves can reduce hand injuries in your plant by one-half?

That sort of safety record is possible if you furnish your employees with gloves, says Jomac Inc., the Philadelphia glove manufacturer.

The reasons: Companies can make sure that their men use the best glove for fullest protection, and replace worn gloves promptly.

Some companies prefer to charge their employees a small part of the glove cost—perhaps 25 per cent. That way, the employee has a stake in ownership and won't be prone to throw still-useful gloves away.

Economics—What does such a program cost?

Gloves are a sizable overhead item. Savings come from other quarters. Employee downtime is reduced, and morale is improved because severe hand injuries are minimized.

Statistics—A survey shows that the average first-aid case involving a hand or arm injury costs about $2.44. Injuries that become infected cost about $39.94 on the average.

Say gloves cost 40 cents a pair and last 40 hours. The prevention of one serious accident could furnish gloves for 99 men for a 40-hour week.

Considerations—The life expectancy of the glove is a major item. If gloves are properly reconditioned when soiled and worn, they will last even longer. Hand guards worn over the gloves further protect the wearer and the glove.

Smoothing Out Production

A rotary straightener solved a "crooked" problem in the fabrication of tubular elements

CROOKED tubing hampered production at the Still-Man Mfg. Corp., New York, until the company installed its own tube straightener.

The firm makes tubular heating elements for electric appliances and immersion heaters. Production requires work with copper, stainless and low carbon steel, aluminum, Inconel and Incoloy tubing.

Troublesome—Still-Man used to depend upon the supplier for the required straightness in the tubes. But when they reached the filling department, where wire heating elements are placed inside them, the plunger rods in the filling machine would get stuck.

Some distortion was felt to be the responsibility of the supplier. More frequently, it came from too much handling by employees.

Solution — Today, close to the filling machinery, there's a model AXY rotary straightener, built by Mackintosh-Hemphill Division, E. W. Bliss Co., Pittsburgh. This machine has reduced tube handling and resulting distortions to a minimum.

ROTARY TUBE STRAIGHTENER
. . . takes out bows, waves and bends

The operator can quickly adjust the six crossed rolls to work on tubing with diameters ranging from ¼ to ¾-in. Tubes are cut in lengths from 13 to 84 in. Wall thickness varies from 0.020 to 0.045 in.

About 50,000 ft of tubing is straightened a day in the Still-Man plant. It has no greater deviation from straightness than 0.008 to 0.009 in. a foot.

ACE IN THE HOLE!

Had this smug feeling lately? Pretty nice! Also profitable! You could feel the same way in the shop, too—if you'd change over to CUT STEEL! For this revolutionary, new type abrasive has been a real money-maker for foundries who have tried it and changed over to it. Made by an exclusive process developed by METAL BLAST, CUT STEEL is *not* air-formed, cast or made from wire. Instead, it is actually *cut* from high quality, alloy steel, in a variety of shapes and sizes. And it's producing spectacular results in the cleaning of castings and forgings. Seems like the happy combination of special material, method of forming and the fact that it work-hardens gives CUT STEEL cleaning properties possessed by no other abrasive.

If you feel the need for cutting costs in your cleaning operation—here's the sure way—change over to new CUT STEEL! A trial order will prove it!

Sooner or later, you too, will change to CUT STEEL!

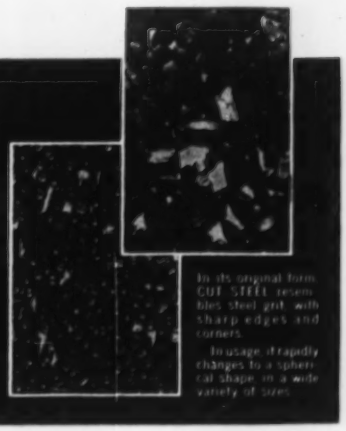
CUT STEEL
ABRASIVE

ANNEALSHOT and SUPER-ANNEALSHOT

PRODUCTS OF

METAL BLAST, INC.

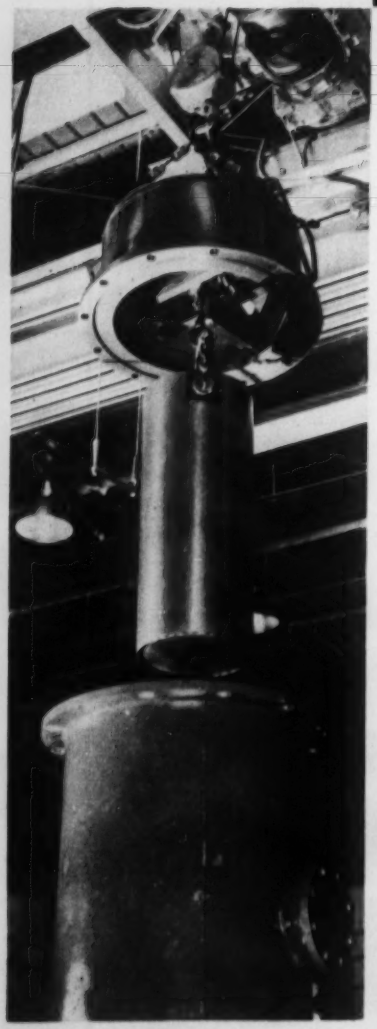
872 EAST 67th STREET • CLEVELAND 3, OHIO



In its original form CUT STEEL resembles steel grit with sharp edges and corners.

In usage it rapidly changes to a spherical shape in a wide variety of sizes.

New Life for Metals



CHARGING—Container filled with metal is lowered into charging chamber. It's melted with alloying elements

WHAT happens when you melt metals in a vacuum?

The metal is purer. Vacuum distills off low boiling point elements, decomposes oxides and inclusions and removes gases. "It's the way to get more from your metal," says the Carboloy Department of General Electric Co.

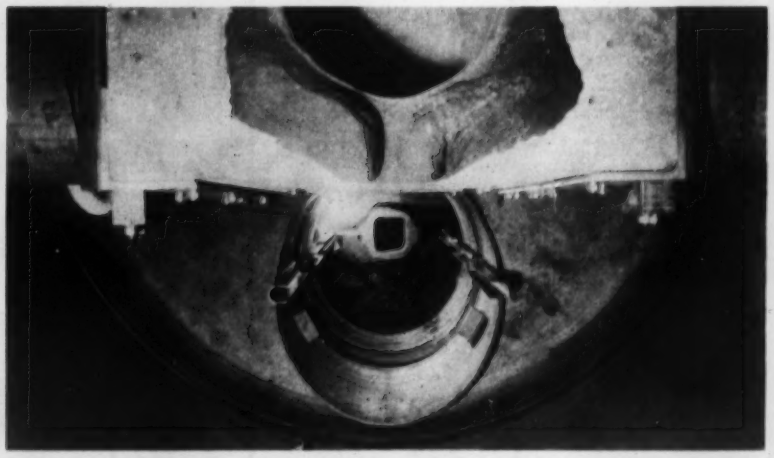
The mechanical properties of many old alloys are improved so much they almost can be called new ones. Brand new alloys are in the offing, too. Some will come from lower cost, less critical metals (such as iron plus aluminum).

Producers will give users more metals alloyed with titanium and zirconium and other elements which cannot be added in quantity in air melting.

Know How—Back of this picture is more than eight years of experience with small-scale melting (4 to 400 lb) in the best nothing GE scientists could devise.

A big step toward commercial reality was taken a few weeks ago when a 1000-lb vacuum furnace started up at Carboloy's Detroit plant (pictures on pages 82 and 83). It will add more than 120,000 lb of vacuum alloys to U. S. capacity per month.

Better—Nickel and cobalt base alloys benefit because there is minimum loss of hardening elements due to oxidation. Better cleanliness gives improved fatigue and stress rupture properties.



READY TO POUR—Ingot mold is ready to be raised into pouring position. A lever tilts the Ajax induction furnace through a hydraulic system

Ductility and workability are better, so there are fewer rejects during fabrication. Another plus: Vacuum melted scrap has excellent remelt value.

Cost in Line—Processors say that when the plusses are counted, they can supply expensive high temperature alloys for about the same price as air melted ones.

Cheaper alloys of low strategic value are needed for gas turbine auto power and vacuum metallurgy may give designers the go ahead on everyday turbines.

Largest use for vacuum metals today is in the turbine field—aircraft, locomotives, stationary power plants, etc. They also are used in the airframe industry for landing gears and struts.

Newcomer — One of the newest alloys planned for the Carboloy furnace is 1570—for high temperature service. Developed by GE, it contains more cobalt and titanium than M-252 (also made in vacuum) to give better creep and stress rupture properties.

Its composition: Carbon, 0.20 per cent; chromium, 20; nickel, 28; cobalt, 38; tungsten, 7; titanium, 4; iron, 2. It's being tested for jet engine buckets and other parts where operating temperature must be as high as possible.

Down the Line—Benefits of vacuum extend to low alloy steels. It holds promise of giving more uniform, higher quality metal for super-strength steels, such as 4340. These steels are heat treated for use at 260,000 to 300,000 psi. Vacuum may be the answer to certain questions on the performance of these high strength steels.

High chromium alloys, like 430 and 446, normally exhibit brittle fracture at room temperature. When vacuum processed, they have a lower transition temperature, which means better room temperature impact strength.

Service life of bearings and springs is related to fatigue strength of the parent alloy. This goes back to alloy cleanliness.

Wire, Too—Lower inclusion content of vacuum melted spring alloys permits wire to be drawn to finer sizes with better surface finish and less breakage.

Better tool and die steels are in the vacuum picture, too.

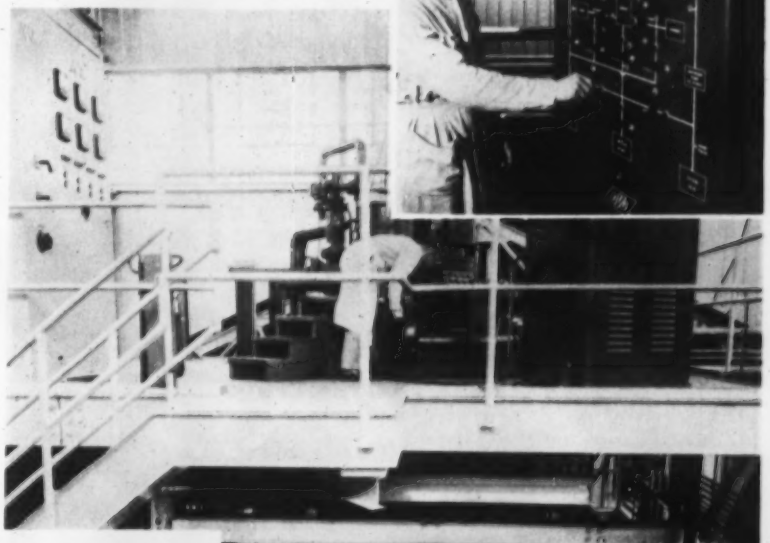
Carboloy scientists predict that vacuum melting may improve corrosion resistance of many materials. Because of this, it may permit use of less costly alloys in some applications.

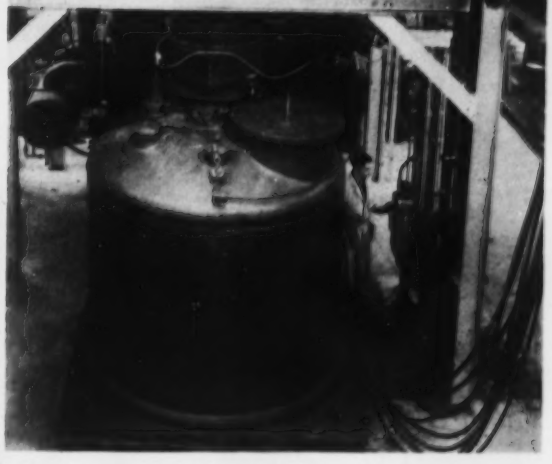
More on Vacuum Metallurgy Coming in STEEL

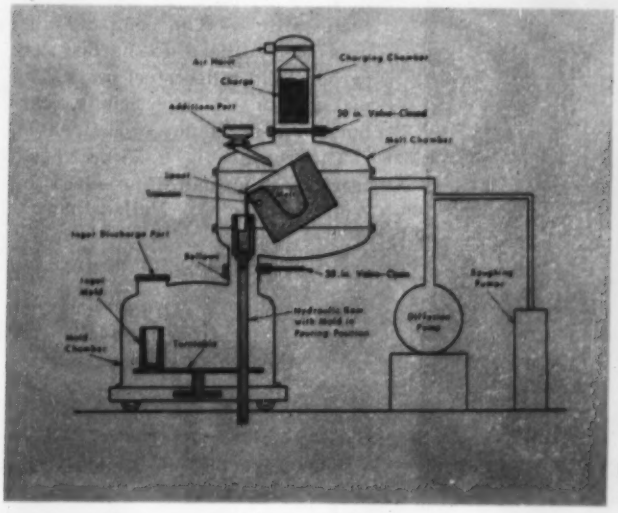
July 25—How Utica Drop Forge & Tool Corp. makes jet engine alloys three times more rugged by melting and casting them in a vacuum.

Aug. 15—How vacuum-melted 52100 and tool steels perform as ball and ring materials at New Departure Division, General Motors Corp.

Extra copies of this article and the two coming up are available in quantities of from one to three until supply is exhausted. Write Editorial Department, STEEL, Penton Bldg., Cleveland 13, O.







The 1000-lb semicontinuous vacuum melting unit at Carboloy, built by Consolidated Vacuum Corp., is three systems tied into one package. One man can run it

Quadruple-Duty Furnace

It saved nearly $37,000 in heat-treating costs during an 8-month period

ONE salt bath furnace is doing four jobs at the G. H. Leland Co., Dayton, O. It carburizes, brazes, does simultaneous brazing and case hardening and hardens.

More than 500 different punched, stamped and machined parts for rotary solenoids, circuit selectors and relays are processed in the unit. The furnace uses a water soluble carburizing salt and operates at temperatures from 1550 to 1650°F.

Costs Down—One secondary operation, simultaneous brazing and carburizing, eliminated three materials handling operations and cut unit costs 80 per cent—from $79 to $13 per 1000 parts.

CARBURIZING
. . . a charge of rotary solenoid cases

Another secondary operation, brazing (case hardening not required), cut unit costs from $14.20 to $9.10 per 1000 parts.

Versatile — The company also uses the furnace to harden low carbon, cold rolled steel parts. The pick-up of a superficially carburized case is not objectionable.

The furnace is a 65-kw, heat-treater's Shopsmith, produced by Ajax Electric Co., Philadelphia.

For Smoother Copper Plates

Electroplaters can get smoother copper plates from high-efficiency baths when the copper is supplied from high-purity, high-density cast anodes rather than ordinary, cast, rolled or electrolytic-copper anodes, says Battelle Memorial Institute, Columbus, O.

✓ happy balance between dependable performance and moderate cost

Tru-Rol *precision, steel-cage, heavy-duty bearing with contoured guide lips assuring true right-line rolling, maintained roller alignment and thin oil film.*

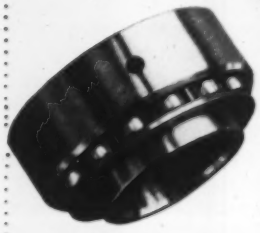
● Rollway's *TRU-ROL* Steel-Cage Bearings afford wide latitude in balancing *dependable* performance, *long* life, and *high load* capacity against *moderate* cost. They rate high in any comparison on a cost-performance basis.

A choice of stamped steel retainers with contoured guide lips, or steel segmented retainers assure true rolling and an evenly distributed *thin* oil film — *big factors in reducing power losses and heating.*

"Crowned" Rollers Relieve End Stress

TRU-ROL offers the extra advantage of a finish-ground "crown" radius on the roller ends. That relieves high end-stress and insures uniform load distribution over the entire length of the roller. The result: *TRU-ROL* Steel Cage Bearings carry heavier loads over longer periods without excessive end-fatigue. They are less affected by slight misalignment or shaft deflection.

Investigate *TRU-ROL* Steel Cage Roller Bearings before selecting any bearing in the medium price range.



TYPE D

Rollway Metric Series Steel Cage Roller Bearings

● Rollway Metric Series Steel-Cage Bearings offer the greater load capacity of solid cylindrical rollers, plus the true right-line rolling of trunnion rollers turning in a rigid steel cage. There's no roller skew, no pinch out, no cam action. Design permits maximum bearing capacity . . . within small space . . . at moderate cost.

Give the Cold Water Cure to your METAL CLEANING

...with HOUGHTO-CLEAN COLD CLEANERS

Here's just what the doctor ordered to improve production, raise morale in hot, steamy cleaning rooms!

Houghto-Clean cold cleaners work at high efficiency at room temperature in either still tank or power washers. And HOUGHTO-CLEAN also provides these other definite benefits:

STEADIER PRODUCTION: New comfort for workers means no seasonal dip in production. Moreover, cool parts are more easily handled.

EFFICIENCY: Highly effective on normal plant soils, at low cost. Solution life is long.

ECONOMY: You do without costly heating equipment and eliminate high fuel bills.

SAFETY: Freedom from fire danger; non-toxic; non-irritating.

Get the convincing story on HOUGHTO-CLEAN cold cleaning efficiency from the Houghton Man or by writing to E. F. Houghton & Co., 303 West Lehigh Ave., Philadelphia 33, Pa.

Automatic Shell Core and Mold Blower Ups Production

The new Sutter SP-1300 produces hollow and solid, resin-sand mix cores or shell molds which are fully cured and ready for use. Production rate: 50 to 90 cycles an hour.

The machine produces cores and molds with precision backs as well as faces. This feature permits a stack molding operation. Molds poured horizontally need no support; molds poured vertically may be supported in fixtures. No backing material is needed.

Precoated sand is used. It may be coated with liquid resin or a dry resin-alcohol mix. With the latter, a core sand muller may be used for mixing.

The machine goes through one cycle automatically; a pushbutton starts the cycle. Electric switches, timers and solenoid valves control air cylinders which move machine components.

Corebox halves are heated by gas-fired, radiant ceramic burners which are adjustable individually for heat distribution on the box. A bank of burners heats the top half of the box, another the bottom. Thermocouples in each box half control gas to the burners to hold the box at a predetermined temperature—usually 450 to 500°F. The blowplate on the machine is water cooled to prevent sand build-up.

A cycle: Starting button closes machine. Top and bottom of box move together vertically; corebox, however, is horizontal with blow opening to the rear. Corebox in clamping device is rocked back 90 degrees to engage blowplate against pressure box containing sand-resin mix. Air cylinders, which tilt the corebox, hold it and the blowplate against the pressure chamber during the blow. Sand is blown into the box (blow usually lasts 3 to 7 seconds).

Corebox is rocked to the vertical and the top half is raised ¼-in. Top and bottom pins, which rest against the core, remain stationary. This permits a clean draw with no breaking of the core at the parting line. At ¼-in. the top pins start to raise with the top of the box for an additional 3½-in. Then the bottom pins raise the core 3½-in. out of the bottom half of the box. The total opening, face to face of corebox halves, is 7¼-in.

The finished core is removed and the start button pushed to repeat the cycle.

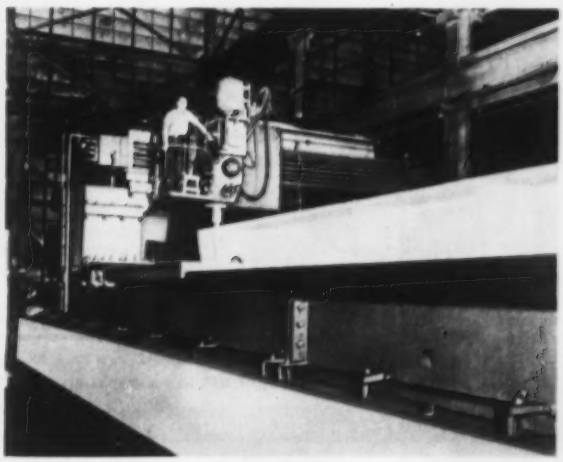
The SP-1300 takes a box 14 x 24 x 7 in. deep. Plans are to offer the machine in a larger size, possibly to handle a 20 x 60-in. pattern box. *Write:* Sutter Products Co., 2005 Westwood Ave., Dearborn, Mich. *Phone:* Logan 3-4400.

Milling Machine Handles Boxcar-Size Castings

This gantry-type mill has a work capacity of 17 x 70 ft. It is hydraulically driven, equipped with a Portland-built Power Pack and a 50-hp heavy-duty milling head.

A hydraulic equalizing system, tracer controlled, prevents seesawing in the longitudinal travel of the rail along the ways. The equalizing system, wholly embodied in the rail, insures an accuracy of 0.002 in. in parallelism, throughout the length of the ways. It also assures a fine finish; relatively few feed marks show in the work.

It is possible and practical to extend the ways indefinitely, within building limitations, to accommodate any length workpiece. Height variation of the rail can be made by inserting risers between the rail and the saddles. *Write:* Portland Machine Tool Works Inc., South Portland, Me. *Phone:* 3-0231



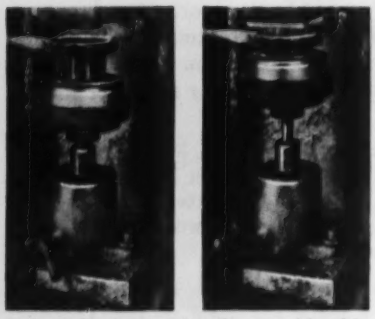
The EASY-FLO equation for strong, low-cost metal joining

PREPLACING THE ALLOY, plus a fast handling and heating setup – that's the EASY-FLO low-temperature silver brazing equation for fast, economical production of virtually indestructible metal joints.

A TYPICAL EXAMPLE is the clutch drum of the HOMELITE Model 17 Chain Saw—noted for its go-power to cut fast without forcing or jamming. At left you see how this drum is produced. EASY-FLO 45 washers and parts are assembled and are then Handy Fluxed and induction brazed with a time cycle per assembly of *only 24 seconds.*

. . . and how's this for STRENGTH?

The manufacturer – HOMELITE CORP., reports: *"there hasn't been a field failure in the 5 years the drums have been EASY-FLO brazed."* Considering the rough, tough, stop-go character of chain saw operation, this provides convincing proof that EASY-FLO joints are virtually indestructible.



Left: Induction brazing fixture with table in loading position. Air valve raises table to brazing position (right). Both joints are brazed at same time.

Unretouched photo shows one of the assemblies after testing to destruction. Despite the terrific force it took to tear the drum apart, the EASY-FLO 45 joints are still intact. That's typical EASY-FLO BRAZED STRENGTH.

Get the full story in Bulletin 20

This bulletin tells why EASY-FLO brazing is inherently fast, reliable and economical. It also gives valuable data on joint design and fast brazing production methods. Write for a copy today.

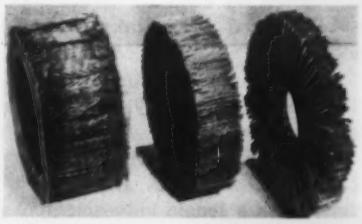
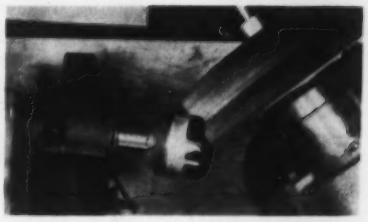
NEW PRODUCTS and equipment

Contour Polishing Wheel

A wearable, coated abrasive wheel, called "Kon-Toor," permits polishing of complex contours with great efficiency. Designed for straight-line and rotary automatic polishing equipment, it is equally adaptable to semiautomatic fixtures.

Advances offered for automatic polishing at production rates include: Development of fine finish





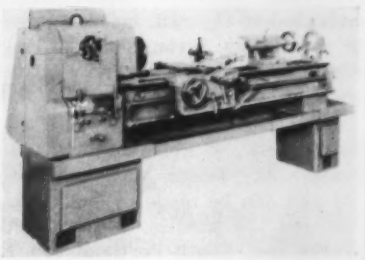
on involved contours; maintenance of original contour through the life of the wheel; elimination of one or more buffing stations.

Wheels are made of U-shaped packets of folded, coated abrasive sheets with grain on both sides. Bushings are provided to fit standard drive spindles. *Write*: Behr-Manning Division, Norton Co., Troy, N. Y. *Phone*: Arsenal 3-0100

Engine Lathes

Model LE "Tray-Top" lathes are made in 10, 12½, 15 and 18-in. sizes. They have 12 spindle speeds in geometric progression, 48 thread and feed changes.

The lathes are offered with a 1,

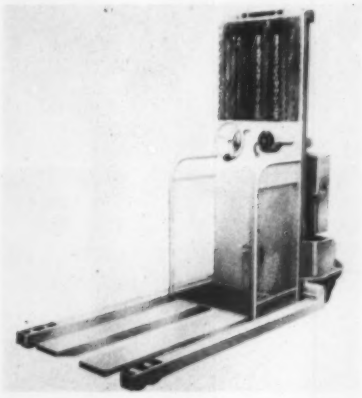


1½, 2 or 3-hp motor mounted on the rear of the headstock leg. *Write:* Cincinnati Lathe & Tool Co., Cincinnati 9, O. *Phone:* Redwood 2121

High-Lift Fork Truck

All controls of the new Jack-Stacker are mounted on the fork carriage of the truck. The operator rides up with the load on a fully protected platform.

Made in capacities to 4000 lb,

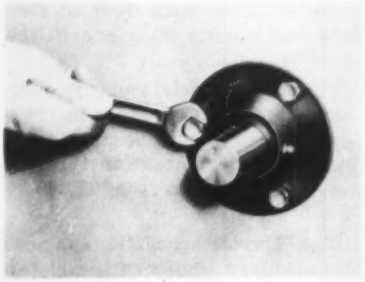


the unit is available in pallet or platform models, with standard lift heights to 129 in. *Write:* Dept. R-19, Lewis-Shepard Products Inc., Watertown, Mass. *Phone:* 4-5400

Roller Bearing

Designed for farm and materials handling equipment, this cartridge roller bearing is housed in a flexible Neoprene housing. Called the Rollway Flexi-Flange, it has excellent load-carrying characteristics and allows for alignment of shafts.

Shaft limits for the unit are ½ to 1 7/16-in. The ½-in. size supports a radial load of 415 lb at



TOUGH!

U. S. Patent #2184926
(Other patents pending)

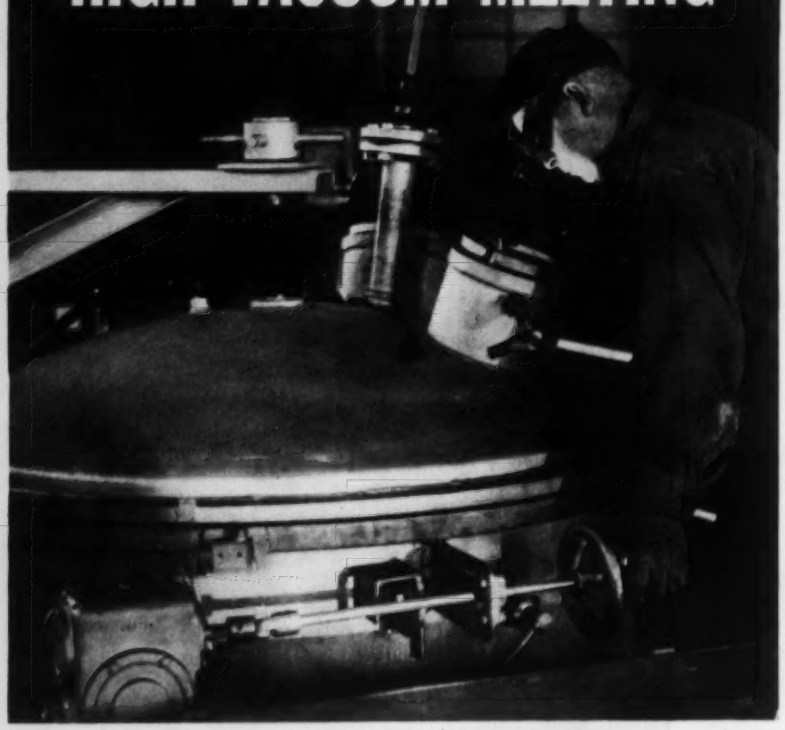
Is your present abrasive tough enough to prove itself in performance? You can't judge an abrasive by looks, claims or promises. The only test of any abrasive is its *cost per ton of castings cleaned.* Because of exclusive metallurgical characteristics, Malleabrasive gives you the lowest cost per ton cleaned of any premium abrasive on the market! This has been proved in hundreds of production tests by users throughout the country. Prove it in your own production test—put muscle behind *your* blast cleaning with Malleabrasive! *We GUARANTEE that Malleabrasive will give you lowest cost per ton of castings cleaned.*

To order Malleabrasive, or for additional information on running a test, contact Globe Steel Abrasive Co., Mansfield, Ohio.

MALLEABRASIVE

What's the New "Magic" in Metals?

HIGH VACUUM MELTING



Technician viewing melt in NRC Vacuum Furnace from which come metals and alloys with new properties of strength, toughness, "cleanliness".

At Last . . . we've broken the barrier of Conventional Metal Properties!

Is your product made of metal? Is it facing increasingly tough performance demands from your customers? Have classical methods of melting, heat treating, annealing, alloying failed to yield the materials with which you can achieve the results demanded of you? What you want are the facts on *Vacuum Melting*. Out of NRC Vacuum Furnaces come metals and alloys with more closely controlled composition . . . purer . . . free of entrapped gases. They are stronger, tougher, "cleaner" than ever before. Make sure your product designers and metallurgists have the information in our Vacuum Furnace Bulletin. Write today.

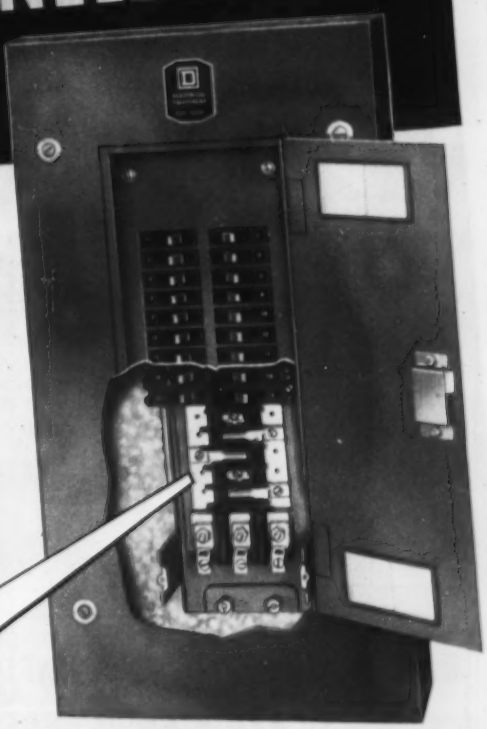
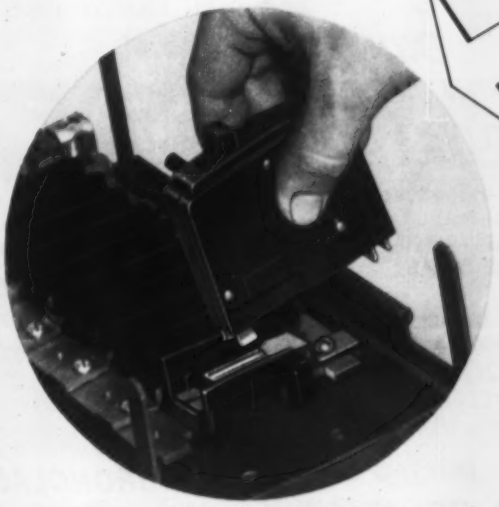
NQO LIGHTING PANELBOARD *with* QO... FINEST BREAKER EVER BUILT!



...Get the complete line "Off-the-Shelf" from your Electrical Distributor or have assembled panels shipped right to the job

It's a top quality line throughout! Note the compact, streamlined beauty. A closer look reveals such outstanding features as: Distributed phase bus arrangement with clear identification for simplified load balancing. Adjustable, indicating trim clamps. Galvanized box with large gutters for real accessibility, yet compact enough to mount between 16" wall studs. Most important of all—the new NQO panelboard offers you the finest breaker ever built, with exclusive **SWINGRIP** mounting.



NEW QO BREAKER with Exclusive SWINGRIP mounting

No other breaker has all these features which make QO the finest breaker ever built!

- Plug-In for maximum flexibility as well as ease of installation and maintenance.
- Quick-make, quick-break mechanism provides positive operation, has excellent "feel". Assures positive operation and long life under all circuit switching conditions.
- Compensated thermal trip enables breaker to carry full allowable load under varying ambient temperatures.
- Sensitive calibrated magnetic trip assures quick and consistent response to harmful overloads or short circuits.
- Non-interchangeable design discourages the use of 30, 40 and 50 ampere units where 15 or 20 ampere breakers have been installed.
- Trip indication on overload or short. Handle moves to middle position.
- Positive action of handle against contact members guarantees circuit opening.
- Compact design—¾" width for each pole conserves valuable space.
- Exclusive **SWINGRIP** mounting provides easier installation, automatic alignment, positive contact with bus bars.

Yes, now you can obtain Garlock O-Rings direct from our branch warehouse nearest you. Each of our warehouses stocks 70 durometer rubber O-Rings in all popular standard sizes. For you this reduces delivery time to a minimum.

You can rely on Garlock O-Rings, too. They're made to Garlock's rigid quality standards. This means O-Rings with precise tolerances, a flash-free finish, and utmost uniformity.

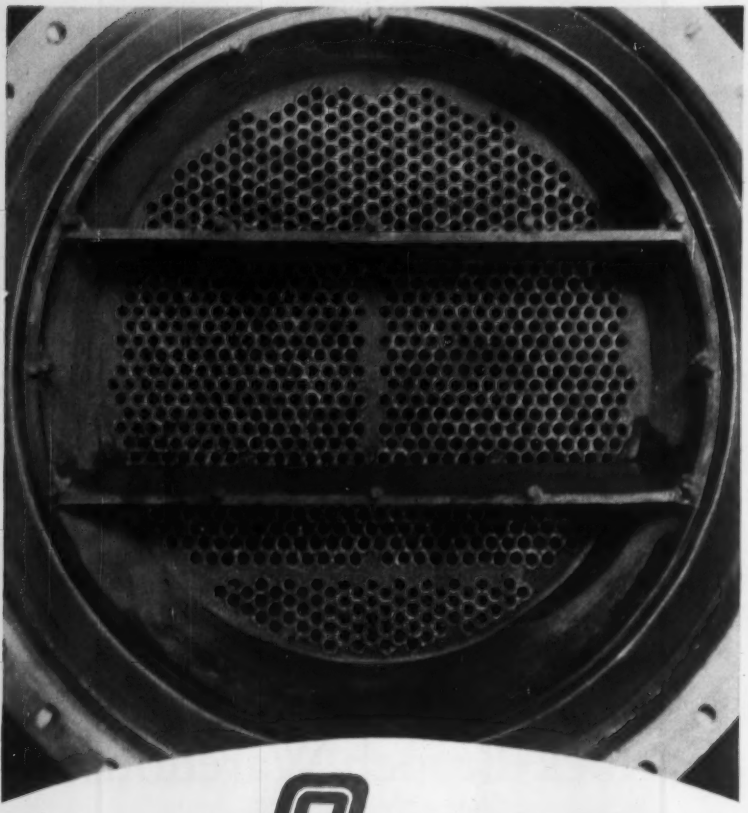
For complete information, just contact your Garlock office or write for new O-Ring folder AD-148.

THE GARLOCK PACKING COMPANY, PALMYRA, NEW YORK

In Canada: The Garlock Packing Company of Canada Ltd., Toronto, Ont.

GARLOCK

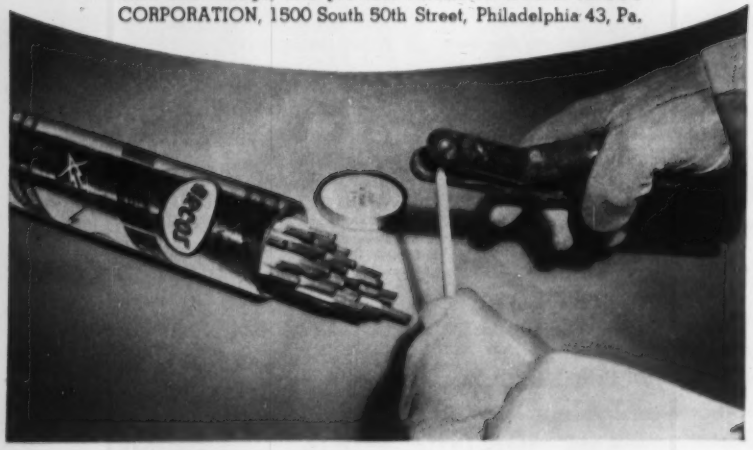
Save time, money and worry when welding stainless steels



WELD WITH ARCOS

STAINLESS ELECTRODES

Arcos controls in manufacture guarantee highest quality weld metal easily deposited. Widest electrode selection in the industry enables you to meet accurately the physical, chemical and metallurgical requirements of every job. Special ELECTRO-PAK prevents moisture pickup and chipped coatings in shipment and storage, also provides resealable feature. ARCOS CORPORATION, 1500 South 50th Street, Philadelphia 43, Pa.



NEW PRODUCTS and equipment

versible motors for proper wheel rotation for both left and right-hand tools.

Silicon carbide, aluminum oxide or diamond wheels may be used to grind carbides, cast alloys or high-speed steels. *Write*: Ex-Cell-O Corp., 1200 Oakman Blvd., Detroit 32, Mich. *Phone*: Townsend 8-3900

Drilling, Tapping Unit

The model 410 automatic machine accurately locates and holds rivets or other headed parts for axial tapping or drilling.

Production in mild steel: No. 30 drill, 9/32-in.-deep holes, 40 a minute; No. 17 drill, 5/32-in.-deep holes, 45 a minute; No. 8-32 tap, 3/16-in.-deep holes, 80 a minute. *Write:* Batchelder Engineering Co. Inc., 125 Main St., Springfield, Vt. *Phone:* 3101

Sintering Furnaces

"Furnaces for Sintering Powder Metal Products" illustrates the units available from this company—bulletin B-101, 12 pages. Drever Co., Bethayres, Pa.

Handling Survey

Here is a case study on a materials handling problem that was solved with fork lift trucks—job study 145. Towmotor Corp., 1226 E. 152nd St., Cleveland 10, O.

Aluminum Sheet Wall Chart

Weight and bend data on aluminum sheet in standard alloys are presented. Industrial Service Division, Kaiser Aluminum & Chemical Sales Inc., 1924 Broadway, Oakland 12, Calif.

Adjustable Speed Drive

The simplicity of operation and economy of the general-purpose, full-wave Thy-mo-trol is detailed—GEA-6234, 8 pages. General Electric Co., Schenectady 5, N. Y.

Steel Strapping

Heavy-duty, flat steel strapping equipment and accessory items are illustrated—8 pages. Gerrard Steel Strapping Division, 2915 W. 47th St., Chicago 32, Ill.

Lubrication Pumps

Four bulletins describe this line of equipment—Nos. 5531, 5533, 5535 and 5537, 2 pages each. Trabon Engineering Corp., 1814 E. 40th St., Cleveland 3, O.

Ore Agglomeration

Descriptions, characteristics of processes and technical data in this field are given—booklet E-32, 24 pages. American Ore Reclamation Section, Engineering and Construction Division, Koppers Co. Inc., Koppers Bldg., Pittsburgh 19, Pa.

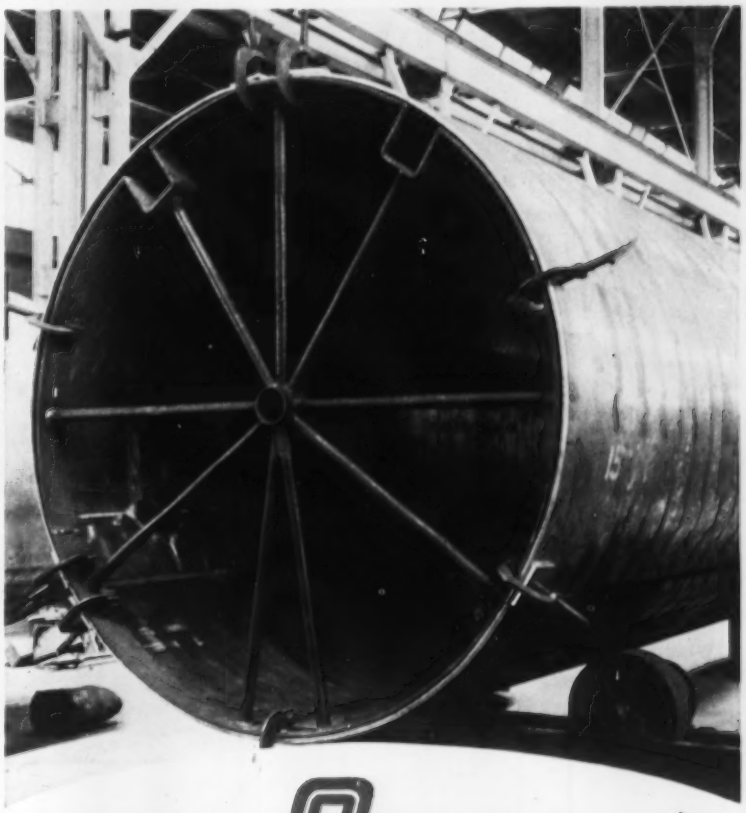
Cold-Formed Fasteners

Fastening information is given in a series of data sheets titled, "Cold-Forming Design Data." Townsend Co., New Brighton, Pa.

Asbestos Textiles

This manual covers asbestos lap, roving, yarn, cloth, tubing, cord, wick, rope and tape—16 pages. Johns-Manville, 22 E. 40th St., New York 16, N. Y.

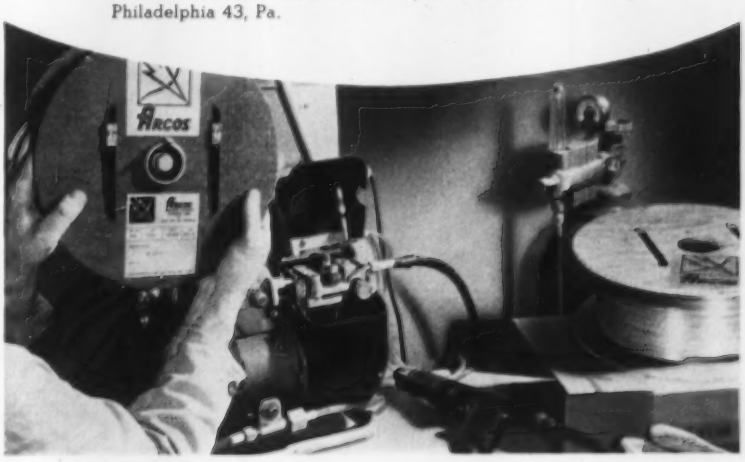
How to improve quality on every aluminum job welded by inert gas



WELD WITH ARCOS

ALUMINUM SPOOLED WIRE

The advantages of aluminum weld-fabrication are many. But only a quality weld metal can produce them with maximum benefit. Arcos manufacturing controls applied to ALUMAR Spooled Wire are a sure guarantee. Within a critically controlled range you can meet every characteristic with "peace of mind". ARCOS CORPORATION, 1500 South 50th Street, Philadelphia 43, Pa.



Paying for AMERICAN PHILLIPS Screws without using them is "pouring money down the drain"!

Many plants paying *less* (on the face of the price tag) for old-fashioned fastening methods . . . are actually paying *more* than they would have to pay for American Phillips Screws. For these modern fasteners not only prevent lost material, lost-time accidents, and rejected product . . . they also speed up assemblies as much as 50%. That's why they *always cost least to use.*

And in addition to these Phillips advantages, there are many special American advantages . . . unlimited supplies of all sizes, types and head styles . . . engineering service with an unmatched record of solving special problems . . . quality guarded by self-checking inspection system . . . full measure assured by precision counting. That's why more and more mass producers of hard goods "buy American" every year . . . because they know their production lines will keep rolling. And *you* can have this same peace of mind.

✕ *marks the spot*
. . . the mark of extra quality

Office, Detroit, Michigan

STEEL
July 4, 1955

Market Outlook

LOOK for second-half steel production to be below that of the first, even though the metalworking industry expects a 2 per cent gain in its sales.

In the first half, the steel industry was filling the pipelines of supply and building consumers' inventories to support an increased rate of consumption. That is accomplished, and the steel industry needs merely to turn out enough for the current rate of usage.

OVER THE DAM—One of the incentives to build inventories is gone. It was the aim to get deliveries before a midyear increase in steel prices.

Although the metalworking industry expects a 2 per cent gain in sales in the second half over the first (see STEEL, June 27, p. 37), all segments of it will not fare alike.

SLOWDOWN—The automobile industry (biggest consumer of steel) expects to produce 18 per cent fewer passenger cars in the third quarter than in the second, even though it raised its sights from earlier projections for the third quarter. Much of the third period will see model change-overs, which interrupt production. The first and second quarters had no such interruptions. Some of the auto producers already have asked that deliveries on some of their steel orders be deferred.

CONTRASTS—In contrast, the government says construction (second largest user of steel) will be 5.8 per cent better than estimated earlier for this year.

Railroads have begun to show some life in their freight car buying.

If steel production were to continue in the last half at the brisk pace of the first, the year's outturn would be 114.8 million net tons of ingots and castings. That would be more than the record of 111.6 million net tons set in 1953, when the first-half's yield of 57.9 million tons exceeded the 57.4 million tons of the first half of 1955.

NO SLACK—Although steel demand may ease off in the second half, don't count on a shortening in delivery times. Steel output will be down, too. Summer vacations and hot weather reduce steel production in July and August. Some of the steelmaking furnaces will have to be taken off for repairs. They have been pushed to rated capacity or above, and they can't stand that continuously.

OUTPUT OFF—A decline is already recorded for the opening of the second half. Because mills had to prepare for a steelworkers' strike, the ingot rate in the week ended July 3 slipped to a preliminary 94.5 per cent of capacity. That's a 2.5 point decline from the preceding week.

OPTIMISTIC—Even though the second-half outlook is for reduced steel output, the steel industry is optimistic about the long haul. Eleven producers applied to the Office of Defense Mobilization in the first half for accelerated tax amortization privileges on 70 projects totaling a billion dollars (see page 35). It would be 1959 or 1960 before those projects could be completed. ODM has no steel expansion goal now, but the producers are lining up just in case there is one.

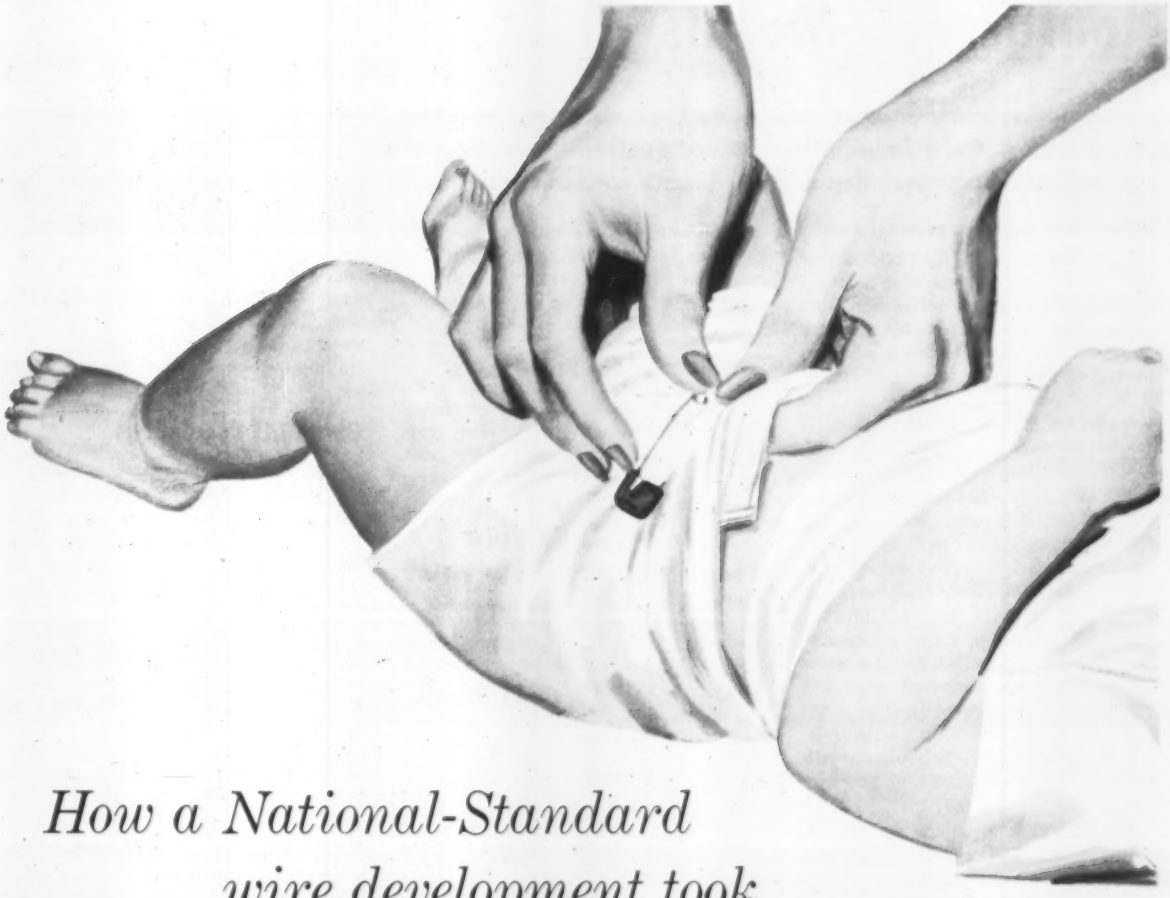
What You Can Use the Markets Section for:

- **A source of price information.**
  Current prices are reported each week. Price changes are shown in italics. Price trends are shown in tables of indexes and comparisons.
- **A directory of producing points.**
  Want to know who makes something, or where it is made? The steel price tables alphabetically list the cities of production and indicate the producing company. If you are a buyer, you may want to make a map showing comparative distances of sources of supply and to help you compute freight costs. If you are a seller of supplies you can make a map to spot your sales possibilities.
- **A source of price data for making your own comparisons.**
  Maybe you want to keep a continuous record of price spread between various forms of steel. You can get your base price information from STEEL's price tables.
- **A source of information on market trends.**
  Newsy items tell you about the supply-demand situation of materials, including iron and steel, nonferrous metals and scrap. Other articles analyze special situations of interest and importance to you.
- **Reports on iron and steel production, and materials and product shipments.**



How a National-Standard wire development took

A BETTER "REEF" IN BABY'S PANTS

● Almost any product can be made better. Take safety pins.

A prominent manufacturer came to National-Standard with this idea: "Give us," he said, "a polished wire that needs no plating, yet won't corrode . . . a better, stronger, springier wire to which we can attach a plastic head."

A National-Standard research team took on the problem . . . and produced a special stainless steel wire with a mirror finish that needed no further polishing. They gave it magnetic properties so that bits of steel could be easily removed from the plastic compound used for heads . . . to protect costly dies and equipment. They gave it a special temper that made it springier, tougher, yet still easy to form.

Thousands of manufacturers have learned to depend on National-Standard for development and manufacture of special types of wire, wire cloth and strip steel . . . fussy, hard-to-make products that many companies hesitate to tackle. Why not give us a call and see what we can do for *you*.

Nonferrous Metals

Yates subcommittee comes up with an equitable distribution plan for aluminum in the third quarter. It won't mean much if Commerce department doesn't cut scrap exports

Nonferrous Metals Prices, Pages 104 & 105

AN EQUITABLE DISTRIBUTION plan for aluminum has been evolved by the Yates subcommittee. It sets up an approximate 60-40 split of the domestic supply between primary producers and nonintegrated users. It is a "paper" plan, however, dependent on export control action by the government—no action, no equitable distribution.

According to the committee's report to Defense Mobilizer Arthur S. Flemming, the total estimated supply of aluminum in the third quarter will be 1114 million lb, made up of 786 million lb of domestic production, 128 million lb from Aluminum Co. of Canada and 200 million lb of scrap. The nonintegrated users are on the books of the Big Three for 236 million lb; they'll get 60 million lb from Alcan; and they'll get about 80 per cent of the scrap, or 160 million lb.

Big IF—That gives the small businesses about 456 million lb of pig, ingot, billet or scrap, leaving about 648 million lb for the primary producers. The subcommittee believes this is a fair plan, but only if the Office of Export Supply of the Commerce department plays ball and curbs exports of aluminum scrap. This action has been urged by the industry since the pinch in supply began in the first quarter.

The government responded by imposing token restrictions which allowed exports of both primary and scrap aluminum to remain at 1954 levels but kept them from becoming larger. Last year was a big one for aluminum exporters. They sent more than 78.5 million lb overseas. Both the primary and secondary producers have requested the government to put a quota on scrap of 1 million lb a month. As of this writing, the Commerce department had made no move on the requests of the producers or the subcommittee.

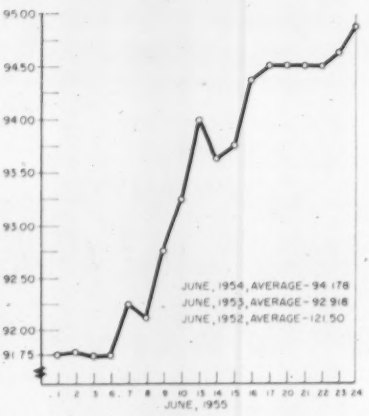
Big Omission—One big point the subcommittee left out of its report to Mr. Flemming was the role of the nonintegrated manufacturer who doesn't use pig, ingot or billet. He buys his semifinished products—sheet, plate, extrusion stock, etc.—from the bigger producers for further processing into end items or components. Some industry men believe that is a more serious problem than the main subject of the subcommittee's investigation.

Where Will Tin Price Stop?

The big question in the tin industry is where will the price stop. As the chart below shows, the spot price of Straits tin at New York rose 3.125 cents in the first three weeks of June. It was still going up last week (95.00 cents at this writing). At that rate it may soon reach the high point of 1954, when the price was about 96.75.

Spot Tin Price Heading for Old Levels?

(Straits at New York, cents per pound)



Small Copper Producers Balk

The attitude of the smaller copper producers regarding government-deferred metal has further dampened the outlook of the industry for some immediate supply relief. It is reported from Washington that these producers do not want to deliver to civilian customers the metal released by the government in the second and third quarters. Many of these firms are high-cost producers. They feel that delivering in small quantities to individual customers as compared with large deliveries to the government would raise costs too much. In addition, they are looking ahead to the time when the stockpile portion of the diversions must be paid back. At present, stockpile repayments are scheduled for no later than Dec. 31, 1955, and Mar. 31, 1956. Most observers see the copper shortage extending well into 1956, and these small producers feel that to divert now and pay double later may be like robbing Peter to pay Paul.

Obey DMS Regulations

The best way to assure yourself of sufficient copper for defense and Atomic Energy Commission work is to identify your orders to suppliers of copper controlled materials as required by Defense Materials System Reg. 1. According to the Copper Division of Business & Defense Services Administration, some contractors and subcontractors are not doing this, resulting in nondelivery of materials for some vital work. BDSA points out that there is plenty of metal available for such orders, 108 million lb having been set aside in both the second and third quarters.

BDSA says in the *Copper Industry Report* for the spring quarter that aside from the legal aspects of the situation and prompt delivery, proper marking of defense orders leads to the following benefits for the user: "It provides the springboard for 'full mobilization' for . . . defense . . . in case of enemy attack. Secondly, it provides a 'defense shipment pattern' which may be one of the factors considered for: Allocations under mobilization conditions, tax amortization, contract negotiation or other dealings with the government."

This applies equally well to aluminum and steel, the other metals under DMS regulation, BDSA officials point out.

Market Memos

- Bache & Co. thinks the 36-cent price of copper is harming fabricators. The company proposes freeing the price and making it responsive to the law of supply and demand.
- Stainless steel producers are allocating their products to warehouses, according to the Bulletin of the National Association of Purchasing Agents. They may be doing likewise to civilian industrial consumers by now. The reason: The nickel shortage.

Cents per pound, carlots, except as otherwise noted

PRIMARY METALS AND ALLOYS

Aluminum: 99 + %, ingots 23.20, pigs 21.50, 10,000 lb or more, f.o.b. shipping point. Freight allowed on 500 lb or more.

Aluminum Alloy: No. 13, 12% Si, 25.00; No. 43, 5% Si, 24.80; No. 142, 4% Cu, 1.5% Mg, 2% Ni, 26.50; No. 195, 4.5% Cu, 0.8% Si, 25.90; No. 214, 3.8% Mg, 26.40; No. 356, 7% Si, 0.3% Mg, 24.90.

Antimony: R.M.M. brand, 99.5%, 28.50, Lone Star brand, 29.00, f.o.b. Laredo, Tex., in bulk. Foreign brands, 99.5%, 27.00-28.00, New York, duty paid, 10,000 lb or more.

Beryllium: 97%, lump or beads, $71.50 per lb, f.o.b. Cleveland or Reading, Pa.

Beryllium Aluminum: 5% Be, $72.75 per lb of contained Be, f.o.b. Reading, Pa., Elmore, O.

Beryllium Copper: 3.75-4.25% Be, $40 per lb of contained Be, with balance as Cu at market price on shipment date, f.o.b. Reading, Pa., or Elmore, O.

Bismuth: $2.25 per lb, ton lots.

Cadmium: Sticks and bars, $1.70 per lb, deld.

Cobalt: 97-99%, $2.60 per lb for 550-lb keg; $2.62 per lb for 100-lb case; $2.67 per lb under 100 lb.

Columbium: Powder, $119.20 per lb, nom.

Copper: Electrolytic 36.00 deld. Conn. Valley; 36.00 deld. Midwest; Lake 36.00 deld; Fire refined 35.75 deld.

Germanium: 99.9%, $295 per lb, nom.

Gold: U. S. Treasury, $35 per oz.

Iadium: 99.9%, $2.25 per troy oz.

Iridium: $90-$100 nom, per troy oz.

Lead: Common 14.80, chemical 14.90, corroding 14.90, St. Louis; N. Y. basis, add 0.20.

Lithium: 99% +, cups or ingot, $11.50; rod, $13.50; shot or wire, $14.50, f.o.b. Minneapolis, 100 lb lots.

Magnesium: 99.8%, self-palletizing pig 28.50; notched ingot 29.25, 10,000 lb or more, f.o.b. Freeport, Tex. For Port Newark, N. J., add 1.40 for pig and 1.45 for ingot; for Madison, Ill., add 1.20 for pig and 1.25 for ingots; for Los Angeles, add 2.50 for both pig and ingot. Sticks 1.3 in. diameter, 49.00, 100 to 4999 lb, f.o.b. Madison, Ill.

Magnesium Alloys: AZ91C and alloys C, H, G and R 34.00; alloy M 36.00, 10,000 lb or more, f.o.b. Freeport, Tex. For Port Newark, N. J., add 1.40; for Madison, Ill., add 0.50; for Los Angeles, add 2.60.

Mercury: Open market, spot, New York, $277-$279 per 76-lb flask.

Molybdenum: Powder 99% hydrogen reduced $3-$3.25 per lb; pressed ingot $4.06 per lb; sintered ingot $5.53 per lb.

Nickel: Electrolytic cathodes, sheets (4 x 4 in. and larger), unpacked 64.50; 10-lb pigs, unpacked 67.65; "XX" nickel shot 69.00; "F" nickel shot or ingots for addition to cast iron, 64.50; prices f.o.b. Port Colborne, Ont., including import duty. New York basis, add 0.92.

Osmium: $80-$100, nom., per troy oz.

Palladium: $20-$21 per troy oz.

Platinum: $77-$80 per troy oz from refineries.

Radium: $16-$21.60 per mg radium content, depending on quantity.

Rhodium: $118-$125 per troy oz.

Ruthenium: $45-$55 per troy oz.

Selenium: 99.5%, $6-$7.25 per lb.

Silver: Open market, 90.00 per troy oz.

Sodium: 16.50, c.l.; 17.00 l.c.l.

Tantalum: Sheet, rod $68.70 per lb; powder $56.63 per lb.

Tellurium: $1.75 per lb.

Thallium: $12.50 per lb.

Tin: Straits, N. Y., spot and prompt, 95.00.

Titanium: Sponge, 99.3 + %, grade A-1 ductile (0.3% Fe max) $3.95, grade A-2 (0.5% Fe max) $3.50 per pound.

Tungsten: Powder, 98.8%, carbon reduced, 1000-lb lots $4.35-$4.40 per lb, nom., f.o.b. shipping point; less than 1000 lb add 15.00; 99 + % hydrogen reduced, $4.65. Treated ingots, $6.70.

Zinc: Prime Western, 12.50; brass special, 12.75; intermediate, 13.00, E. St. Louis, freight allowed over 0.50 per pound. High grade, 13.85; special high grade, 14.00 deld. Diecasting alloy ingot No. 3, 16.50; Nos. 2 and 5, 17.00, deld.

Zirconium: Ingots, commercial grade, $14.40 per lb; low-hafnium reactor grade, $23.07. Sponge, $7.60 per lb. Powder, electronics grade, $15 per lb; flash grade, $11.50.

(Note: Chromium, manganese and silicon metals are listed in ferroalloy section.)

SECONDARY METALS AND ALLOYS

Aluminum Ingot: Piston alloys, 26.75-28.50; No. 12 foundry alloy (No. 2 grade), 25.50-26.00; 5% silicon alloy, 0.60 Cu max, 28.00-28.25; 13 alloy, 0.60 Cu max, 28.00-28.25; 195 alloy, 28.00-28.25; 108 alloy, 26.00-26.50. Steel deoxidizing grades, notch bars, granulated or shot: Grade 1, 26.00-27.00; grade 2, 25.00-26.00; grade 3, 24.50-25.00; grade 4, 23.50-24.00.

Brass Ingot: Red brass No. 115, 34.50; tin bronze No. 225, 45.00; No. 245, 39.75; high-leaded tin bronze No. 305, 38.00; No. 1 yellow, No. 405, 29.25; manganese bronze No. 421, 31.75.

Magnesium Alloy Ingot: AZ63A, 32.00; AZ91B, 32.00; AZ91C, 32.00; AZ92A, 32.00.

NONFERROUS MILL PRODUCTS

BERYLLIUM COPPER

(Base prices per lb, plus mill extras, 2000 to 5000 lb, f.o.b. Temple, Pa.; nominal 1.9% Be alloy) Strip, $1.74; rod, bar, wire, $1.71.

COPPER WIRE

Bare, soft, f.o.b. eastern mills, 100,000-lb lots, 41.35; 30,000-lb lots, 41.48; l.c.l., 41.98. Weatherproof, 100,000-lb, 40.78; 30,000 lb, 41.03; l.c.l., 41.53. Magnet wire deld., 15,000 lb or more, 48.15; l.c.l., 48.90.

LEAD

(Prices to jobbers, f.o.b. Buffalo, Cleveland, Pittsburgh) Sheets, full rolls, 140 sq ft or more $20 per cwt; pipe, full coils $20 per cwt; traps and bends, list prices plus 30%.

TITANIUM

(Prices per lb, 10,000 lb and over, f.o.b. mill) Sheets, $14.00-$14.50; sheared mill plate, $11.00; strip, $14.00-$14.50; wire, $10.00-$10.50; forging billets, $8.75; hot-rolled and forged bars, $8.75.

ZINC

(Prices per lb, c.l., f.o.b. mill) Sheets, 23.00; ribbon zinc in coils, 20.00-20.50; plates, 19.00-22.25.

ZIRCONIUM

Plate, $22; H.R. strip, $19; C.R. strip, $29; forged or H.R. bars, $17; wire, 0.015 in., 1.00c per linear foot.

Copper and Brass: No. 1 copper, 35.50-36.00; No. 2 copper, 34.00-34.50; light copper, 32.25-32.75; refinery brass (60% copper) per dry copper content, 30.50-31.75.

INGOTMAKERS' BUYING PRICES

(Cents per pound, carlots, delivered)

Copper and Brass: No. 1 copper, 35.25; No. 2 copper, 33.25-33.75; light copper, 31.00-32.00; No. 1 composition borings, 27.50-27.75; No. 1 composition solids, 28.00-28.25; heavy yellow brass solids, 20.00-21.00; yellow brass turnings, 19.00-20.00; radiators, 21.00-22.00.

PLATING MATERIAL

(F.o.b. shipping point, freight allowed on quantities)

ANODES

Cadmium: Special or patented shapes $1.70 per lb.

Copper: Flat-rolled 51.42, oval 50.92, 5000-10,000 lb; electrodeposited 49.40, 2000-5000 lb lots; cast 50.54, 5000-10,000 lb quantities.

Nickel: Depolarized, less than 100 lb $1.015; 100-499 lb 99.50; 500-4999 lb 95.50; 5000-29,999 lb 93.50; 30,000 lb 91.50. Carbonized, deduct 3 cents a lb. All prices eastern delivery effective Jan. 1, 1955.

Tin: Bar or slab, less than 200 lb, $1.135; 200-499 lb, $1.12; 500-999 lb, $1.115; 1000 lb or more, $1.11.

Zinc: Bar, 21.00; bar or flat top, 20.00, ton lots.

CHEMICALS

Cadmium Oxide: $2.15 per lb, in 100-lb drums.

Chromic Acid: Less than 10,000 lb 28.50; over 10,000 lb 27.50.

Copper Cyanide: 100 lb 76.80; 200 lb 76.05; 300 lb 75.80; 400-900 lb 75.05; 1000 lb and over 73.05; effective Mar. 24, 1955.

Copper Sulphate: Crystal, 100 lb 21.50; 200 lb 18.50; 300 lb 17.50; 400 lb 17.00; 500-1900 lb 15.50; 2000-10,000 lb 15.25; 10,000 lb and up 1515. Powder, add 0.5 to above prices. Effective Mar. 29, 1955.

Nickel Chloride: 100 lb 46.50; 200 lb 44.50; 300 lb 43.50; 400-4900 lb 41.50; 5000-9900 lb 39.50; 10,000 lb and over 38.50. All prices eastern delivery, effective Jan. 1, 1955.

Nickel Sulphate: 100 lb 38.25; 200 lb 36.25; 300 lb 35.25; 400-4900 lb 33.25; 5000-35,900 lb 31.25; 36,000 lb 30.25. All prices eastern delivery, effective Jan. 1, 1955.

Silver Cyanide: (Cents per ounce) 4-oz bottle, 83.125; 16-oz bottle, 81.875; 80-oz bottle, 79.375; 100-oz bottle, 79.375; f.o.b. St. Louis, New York and Los Angeles. Effective Apr. 6, 1955.

Sodium Cyanide: Egg, under 1000 lb 19.80; 1000-19,900 lb 18.80; 20,000 lb and over 17.80; granular, add 1-cent premium to above.

Sodium Stannate: Less than 100 lb, 72.00; 100-600 lb, 57.60; 700-1900 lb, 55.20; 2000-9900 lb, 53.40; 10,000 lb or more, 52.30.

Stannous Chloride (Anhydrous): Less than 50 lb, $1.582; 50 lb, $1.242; 100-300 lb, $1.092; 400-900 lb, $1.068; 1000-1900 lb, $1.043; 2000-4900 lb, $1.006; 5000-19,900 lb, 94.60; 20,000 lb or more, 88.50.

Stannous Sulphate: Less than 50 lb, $1.281; 50 lb, 98.10; 100-1900 lb, 96.1; 2000 lb or more, 94.10.

Zinc Cyanide: Under 1000 lb 54.30; 1000 lb and over 52.30.

for FAST and SAFE Handling!

This sturdy, fast moving ⅜ yard machine has a lifting capacity up to 16,000 lbs. . . . swings in a full 360° circle. With the New FULL RANGE VISION Cab, the operator can SEE what he is doing, at all times. Promotes greater safety . . . speeds up the job. Other Challenger features include: *Self-aligning, Replaceable Hook Shoes . . . Force Feed Lubrication . . . Full Floating Trunnion-Mounted Tapered Drums . . . Straight-in-Line Engine Mounting with Torque Converter . . . Interchangeability of Parts, etc.*

Unit models are also available in ½ and ¾ yard Excavators . . . Cranes up to 20 tons capacity . . . Crawler or Mobile types . . . Gasoline or Diesel.

METAL POWDERS

(Per pound, f.o.b. shipping point in ton lots for minus 100 mesh, except as otherwise noted)

	Cents
Sponge iron:	
98+% Fe, annealed	15.25
Unannealed:	
Minus 100 mesh	11.75
Minus 35 mesh	9.25
Minus 20 mesh	9.00
Swedish, c.l.f. N. Y., c.l., in bags	11.25
Domestic (Swedish), f.o.b. Riverton, N.J., in bags	9.50
Canadian, f.o.b. shipping point	9.50
Electrolytic iron:	
Melting stock, 99.91% Fe, irregular fragments of ⅛ in. x 1.3 in.	21.00
Annealed, 99.5% Fe	36.50
Unannealed (99+% Fe)	32.50
Unannealed (99+% Fe) (minus 325 mesh)	52.00
Powder Flakes (minus 16, plus 100 mesh)	31.00
Carbonyl Iron:	
97.9-99.8% size 5 to 10 microns	83.00-148.00
Aluminum:	
Atomized, 500 lb drums, frght. allowed	
Carlots	32.20
Ton lots	34.20
Antimony, 500 lb lots	32.00*
Brass, 5000-lb lots	33.00-43.00†
Bronze, 5000-lb lots	54.25-57.25†
Copper:	
Electrolytic	13.75*
Reduced	13.75*
Lead	7.50*
Manganese:	
Minus 35 mesh	61.00
Minus 100 mesh	67.00
Minus 200 mesh	72.00
Nickel, unannealed	94.00
Nickel-Silver, 5000-lb lots	49.75-57.25
Phosphor-Bronze, ¼-ton lots	58.50
Silicon	43.50
Solder	7.00*
Stainless Steel, 302	94.00
Stainless Steel, 316	$1.25
Tin	14.50*
Zinc, 5000-lb lots	17.75-31.50‡
Tungsten	Dollars
Melting grade, 99% 60 to 200 mesh	4.30-4.40
Chromium, electrolytic 99.2% Cr min.	3.50

*Plus cost of metal. †Depending on composition. ‡Depending on mesh. §70% Cu, 20% Zn, 10% Ni; **64% Cu, 18% Zn, 18% Ni.

Footnotes

11,557,196 lb	15,190,388 lb

In 4 months of 1955, shipments of aluminum wire, other than conductor, are 41 per cent of 1954's total of 37,696,979 lb

Source: The Aluminum Association

Going into products like scrub pads and zippers, it's a . . .

Shape with a Future

SALES of aluminum manufacturers' wire have doubled in the last three years. That pace (see figures above) is continuing into 1955.

Comparative figures are available for only the first four months of the year, but it seems clear to industry men that this year will continue to push ahead of 1954 by almost a third. Sales officials of Aluminum Co. of America, Pittsburgh, say the industry's second quarter was on a level with the first. They expect some easing in the third quarter, but increased business in the fourth will make up for it.

Trip to Moon—Last year's production of about 37.5 million lb of aluminum wire would be enough to stretch 4½-times from the earth to the moon. This production is made possible partly because of the metal's competitive position in price with other metals. Alcoa officials state that as other metals become more expensive in relation to aluminum, the lighter metal makes more inroads into products which traditionally used the heavier metals. Its weight, finish and resistance to rust are also in its favor.

Edward C. Manix, vice president of Nichols Wire & Aluminum Co., Davenport, Iowa, says that there is better than a 50-50 chance that you will find the scrubbing pads in the kitchen, the TV antenna guy wires, the air filter in your automobile, zippers in your clothes, screens on the windows and even the needles in the wife's knitting basket are made of aluminum. More rivets, screws and nails are being made of aluminum than ever before (STEEL, June 20, p. 159). "We've never seen anything like aluminum manufacturers' wire in terms of rapid and healthy growth," Mr. Manix says. "So great is the demand . . . that carload shipments representing thousands of miles of wire are becoming common."

By Plane—In an era when rapid delivery is stressed, aluminum wire has a competitive edge. It weighs only about a third as much as common wire of the same dimensions, so it is economical to send it by air. Nichols recently air-shipped 10 miles of 0.010-in. aluminum wire. Its weight: Exactly 5 lb.

Aluminum, as well as most other wire materials, can be drawn into almost any shape or gage. Standard shapes are round, square, hexagonal, rectangular, octangular and crimped round. But most manufacturers will draw other shapes to the customer's specifications. Mr. Manix indicates the range of gages when he says: "Nichols will draw aluminum wire in any diameter from 0.010-in. up to almost 0.50-in. in a wide range of alloys and tempers."

Marching Along—What the ultimate demand for this light product will be is anybody's guess. Mr. Manix says: "It looks to us as if aluminum manufacturers' wire is just beginning to get its stride."

Steel Bars . . .

Bar Prices, Page 106

Fabricators have been pressing bar mills for shipments on old orders while awaiting labor developments. Most users expect to pay higher prices for bars this month, the hike depending on the wage increase granted the steelworkers.

Hot-rolled carbon bar sellers are beginning to open books officially for beyond-September-shipment.

Meanwhile, large rounds, 3 in

and over, and of the hot-top classification, are in tightest supply in the East.

While some of these larger rounds are going into ammunition, principal requirements are for shafting.

Some alloy tonnage is still available for third quarter shipment against new orders, but the supply is dwindling rapidly. Currently, shipments of cold-finished bars are as much as 30 days behind schedule with some producers. Sellers of hot-rolled are booking for October delivery on some sizes in New England.

U. S. Steel Corp. issued revised specification and tolerance extras for hot-rolled bars on specification MIL-S-16974D (Navy), effective June 22.

Wire . . .

Wire Prices, Pages 108 & 109

Some of the wire mills are down for mass vacations, but the practice is not being universally observed this year, certainly not on the scale of recent years.

Demand for high carbon wire is holding up surprisingly well. One maker reports deliveries are running about eight weeks. In general, there are no important arrearages as the third quarter opens, sellers being fairly current with delivery promises.

The mills have been operating close to capacity to get out June tonnage, and it is reported July order books are well filled.

Springmakers are busy. In New England those supplying the automotive industry are producing for 1956 models where changes do not materially affect springs.

Warehouse . . .

Warehouse Prices, Page 111

Distributors reported a surge of orders as the second quarter closed. Demand is heaviest for bars, plates, structural shapes and sheets. June was the best month so far this year for most warehouses, with bookings slightly exceeding the May record.

Although gratified by the upturn, distributors expect the market to settle back in late July and August while the vacation period is in full swing. Part of the recent increase in business is traced to inventory building in anticipation of higher prices.

Sheets, Strip . . .

Sheet & Strip Prices, Pages 107 & 108

Sheetmakers are moving cautiously in making fourth quarter commitments, but there is a definite pickup in scheduling under way. The mills are booked solidly for third quarter. So, rather than remain out of the market, especially now that the second quarter has ended, they are accepting some tonnage on a firm delivery basis.

Most producers will have a carryover going into the fourth quarter, as was the case as they entered the present delivery period. Indications are at least one month will be blanked out in the last quarter to accommodate the overflow from the third period. Consequently, the mills do not plan to enter much new tonnage for October. Some estimate they will have no more than two weeks available of capacity that month, if that much. This applies to cold-rolled and galvanized sheets in particular, but fairly substantial arrearages also are indicated in hot-rolled sheets—a little tonnage is available for late September shipment. Also, some hot and cold-rolled strip is open for September delivery.

The situation in sheet and strip specialties varies. On enameling stock and electrical sheets, delivery promises run late in the fourth quarter. Promises on stainless are not so extended.

the first new zinc phosphate coatings in twenty years!

Cowles TY-BONDS . . . amorphous and non-sludging . . . are *not* revisions of old-type coatings. They are completely new coatings—completely new formulations.

Cowles TY-BONDS form tight, hard, clean coatings . . . even the most severe bending, flexing or twisting cannot remove TY-BONDS. They cover the metal completely, no pin-points of metal are left unprotected. Old-type coatings leave as much as 60% exposed to corrosion!

Cowles TY-BONDS are economical because they are non-sludging. There is remarkably little waste . . . more than 90% goes into the surface treatment. TY-BONDS save time by reducing coating cycles and tank clean-outs, and meet all government specifications.

Your Cowles Technical Representative will be happy to give you complete information on the uses and applications of Cowles TY-BOND zinc phosphate coatings. Write or call today.

Cowles CHEMICAL COMPANY

7016 Euclid Ave. • Cleveland 3, Ohio

Pittsburgh mills note a moderate decline in strip orders as the third quarter opens. This, however, is considered normal for summer.

Despite heavy shipments, production is expected to slip below capacity in July and August. Much needed equipment repairs will slow output some. Also, hot weather and vacation interruptions will force curtailments.

With little open space in order books until fourth quarter, the sheetmakers anticipate little difficulty in passing along to consumers, through higher prices, whatever wage increase is granted the steelworkers.

Tubular Goods . . .

Tubular Goods Prices, Page 110

Tubemakers anticipate an active third quarter. Oil country goods interests are well booked through the summer, but they are not accepting all fourth quarter orders. Some are postponing the opening of books for that period a few weeks. There is enough momentum to sales to assure high-level shipments through remainder of this year.

The continuing strong migration to the West Coast is lending support to the housing boom in that area, with a consequent high demand for pipe.

Ohio Fuel Gas Co., Columbus, O., plans 19 miles of natural gas pipeline and a metering station in north-central Ohio. The project includes 18.9 miles of 16-in. pipe in Hardin and Allen counties.

Another pipeline job is that proposed by Texas Eastern Transmission Corp., Shreveport, La. This involves the laying of a 481.5-mile gas line to partly replace the company's Little Inch line which will be converted to transporting petroleum products. Construction starts within 60 days.

Construction of 16 miles and 32 miles of pipeline, respectively, is projected by the Clinchfield Coal Corp., Dante, Va., and the Kentucky West Virginia Gas Co., Ashland, Ky., for transportation of gas from southwestern Virginia.

Also, the Texas Gas Transmission Corp., Owensboro, Ky., is planning 198 miles of gas transmission line and an additional 20,270-hp compressor capacity along its system in Louisiana, Arkansas, Mississippi, Tennessee, Kentucky and Indiana.

The Southern California Gas Co. and the Southern Counties Gas Co., Los Angeles, have asked the California Public Utilities Commission for permission to construct a 30-in. gas pipeline to bring additional natural gas into California.

Plates . . .

Plate Prices, Page 106

Already strong, plate demand is being boosted by a long deferred pickup in railroad specifications. Further increase on this score the rest of the year is indicated as heavier car inquiry is in prospect.

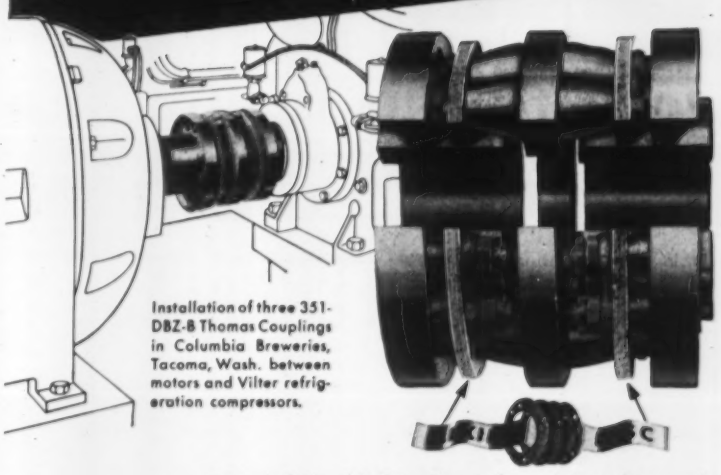
Having held orders off so long, railroads entering the market for cars are pressing for early steel shipments. They are finding that plate makers and other suppliers of car steel are booked up solidly through the third quarter.

Also, there are signs of betterment in ship work.

Buying has been brisk for fabricated line pipe, oil tanks, general purpose industrial equipment, and nonresidential construction. Also, requirements for construction machinery and related equipment, weldments for metalworking equipment and a considerable diversity of other needs have all contributed to a substantial total. A considerable aggregate tonnage has been going into trucks and other heavy types of automotive equipment.

Platemakers generally haven't

THOMAS FLEXIBLE COUPLINGS...
for more years of better service!



Installation of three 351-DBZ-B Thomas Couplings in Columbia Breweries, Tacoma, Wash. between motors and Vilter refrigeration compressors.

Patented Flexible Disc Rings of special steel transmit the power and provide for parallel and angular misalignment as well as free end float.

DISTINCTIVE ADVANTAGES

FACTS	EXPLANATION
NO MAINTENANCE	Requires No Attention. Visual Inspection While Operating.
NO LUBRICATION	No Wearing Parts. Freedom from Shut-downs.
NO BACKLASH	No Loose Parts. All Parts Solidly Bolted.
CAN NOT "CREATE" THRUST	Free End Float under Load and Misalignment. No Rubbing Action to cause Axial Movement.
PERMANENT TORSIONAL CHARACTERISTICS	Drives Like a Solid Coupling. Elastic Constant Does Not Change. Original Balance is Maintained.

THOMAS COUPLINGS ARE MADE FOR A WIDE RANGE OF SPEEDS, HORSEPOWER AND SHAFT SIZES.

Sheets, Strip . . .

Sheet & Strip Prices, Pages 107 & 108

Sheetmakers are moving cautiously in making fourth quarter commitments, but there is a definite pickup in scheduling under way. The mills are booked solidly for third quarter. So, rather than remain out of the market, especially now that the second quarter has ended, they are accepting some tonnage on a firm delivery basis.

Most producers will have a carryover going into the fourth quarter, as was the case as they entered the present delivery period. Indications are at least one month will be blanked out in the last quarter to accommodate the overflow from the third period. Consequently, the mills do not plan to enter much new tonnage for October. Some estimate they will have no more than two weeks available of capacity that month, if that much. This applies to cold-rolled and galvanized sheets in particular, but fairly substantial arrearages also are indicated in hot-rolled sheets—a little tonnage is available for late September shipment. Also, some hot and cold-rolled strip is open for September delivery.

The situation in sheet and strip specialties varies. On enameling stock and electrical sheets, delivery promises run late in the fourth quarter. Promises on stainless are not so extended.

the first new zinc phosphate coatings in twenty years!

Cowles TY-BONDS . . . amorphous and non-sludging . . . are *not* revisions of old-type coatings. They are completely new coatings—completely new formulations.

Cowles TY-BONDS form tight, hard, clean coatings . . . even the most severe bending, flexing or twisting cannot remove TY-BONDS. They cover the metal completely, no pin-points of metal are left unprotected. Old-type coatings leave as much as 60% exposed to corrosion!

Cowles TY-BONDS are economical because they are non-sludging. There is remarkably little waste . . . more than 90% goes into the surface treatment. TY-BONDS save time by reducing coating cycles and tank clean-outs, and meet all government specifications.

Your Cowles Technical Representative will be happy to give you complete information on the uses and applications of Cowles TY-BOND zinc phosphate coatings. Write or call today.

Cowles CHEMICAL COMPANY

7016 Euclid Ave. • Cleveland 3, Ohio

Pittsburgh mills note a moderate decline in strip orders as the third quarter opens. This, however, is considered normal for summer.

Despite heavy shipments, production is expected to slip below capacity in July and August. Much needed equipment repairs will slow output some. Also, hot weather and vacation interruptions will force curtailments.

With little open space in order books until fourth quarter, the sheetmakers anticipate little difficulty in passing along to consumers, through higher prices, whatever wage increase is granted the steelworkers.

Tubular Goods . . .

Tubular Goods Prices, Page 110

Tubemakers anticipate an active third quarter. Oil country goods interests are well booked through the summer, but they are not accepting all fourth quarter orders. Some are postponing the opening of books for that period a few weeks. There is enough momentum to sales to assure high-level shipments through remainder of this year.

The continuing strong migration to the West Coast is lending support to the housing boom in that area, with a consequent high demand for pipe.

Ohio Fuel Gas Co., Columbus, O., plans 19 miles of natural gas pipeline and a metering station in north-central Ohio. The project includes 18.9 miles of 16-in. pipe in Hardin and Allen counties.

Another pipeline job is that proposed by Texas Eastern Transmission Corp., Shreveport, La. This involves the laying of a 481.5-mile gas line to partly replace the company's Little Inch line which will be converted to transporting petroleum products. Construction starts within 60 days.

Construction of 16 miles and 32 miles of pipeline, respectively, is projected by the Clinchfield Coal Corp., Dante, Va., and the Kentucky West Virginia Gas Co., Ashland, Ky., for transportation of gas from southwestern Virginia.

Also, the Texas Gas Transmission Corp., Owensboro, Ky., is planning 198 miles of gas transmission line and an additional 20,270-hp compressor capacity along its system in Louisiana, Arkansas, Mississippi, Tennessee, Kentucky and Indiana.

The Southern California Gas Co. and the Southern Counties Gas Co., Los Angeles, have asked the California Public Utilities Commission for permission to construct a 30-in. gas pipeline to bring additional natural gas into California.

Plates . . .

Plate Prices, Page 106

Already strong, plate demand is being boosted by a long deferred pickup in railroad specifications. Further increase on this score the rest of the year is indicated as heavier car inquiry is in prospect.

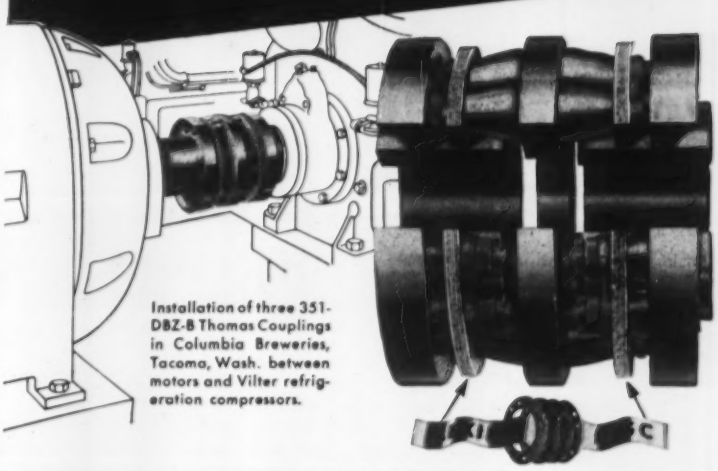
Having held orders off so long, railroads entering the market for cars are pressing for early steel shipments. They are finding that plate makers and other suppliers of car steel are booked up solidly through the third quarter.

Also, there are signs of betterment in ship work.

Buying has been brisk for fabricated line pipe, oil tanks, general purpose industrial equipment, and nonresidential construction. Also, requirements for construction machinery and related equipment, weldments for metalworking equipment and a considerable diversity of other needs have all contributed to a substantial total. A considerable aggregate tonnage has been going into trucks and other heavy types of automotive equipment.

Platemakers generally haven't

THOMAS FLEXIBLE COUPLINGS...
for more years of better service!



Installation of three 351-DBZ-B Thomas Couplings in Columbia Breweries, Tacoma, Wash. between motors and Vilter refrigeration compressors.

Patented Flexible Disc Rings of special steel transmit the power and provide for parallel and angular misalignment as well as free end float.

DISTINCTIVE ADVANTAGES

FACTS	EXPLANATION
NO MAINTENANCE	Requires No Attention. Visual Inspection While Operating.
NO LUBRICATION	No Wearing Parts. Freedom from Shut-downs.
NO BACKLASH	No Loose Parts. All Parts Solidly Bolted.
CAN NOT "CREATE" THRUST	Free End Float under Load and Misalignment. No Rubbing Action to cause Axial Movement.
PERMANENT TORSIONAL CHARACTERISTICS	Drives Like a Solid Coupling. Elastic Constant Does Not Change. Original Balance is Maintained.

THOMAS COUPLINGS ARE MADE FOR A WIDE RANGE OF SPEEDS, HORSEPOWER AND SHAFT SIZES.

Tools and Dies
Heat Treated in...

HEVI DUTY Controlled
ATMOSPHERE FURNACES

Allis-Chalmers of Milwaukee is using Hevi Duty Controlled Atmosphere Furnaces to heat treat tools and dies made from high carbon, high chrome steels, 18-4-1, molybdenum, and cobalt high speed steels. Maintaining the exact surface carbon content of the tools and dies during heat treating is achieved with —

- A Hevi Duty Endothermic Atmosphere Generator supplying 500 cubic feet per hour of prepared atmosphere. With this controlled atmosphere, troublesome scale and decarburization or carburization of the surface is eliminated.
- A Hevi Duty Box Type Hardening Furnace, designed for temperatures to 2000° F., is used for preheating high speed steels and hardening carbon steels.
- A Hevi Duty High Temperature Furnace, designed for temperatures to 2600° F., is used to harden the high speed steels.

This combination assures you that tools and dies can be treated to exact hardness. Achieve better heat treating results by specifying Hevi Duty Furnaces. Write for Bulletin 153.

Dry Type Transformers *Constant Current Regulators*

opened fourth-quarter books officially, although they are virtually out of the market for the third quarter and are receiving an increasing amount of inquiry for the closing quarter of the year. Two producers expect to be in position shortly to book tonnage for delivery beyond September.

A specification extra on firebox plates over 6 to 8 in. inclusive, has been added to U. S. Steel Corp.'s schedule. The revised list became effective June 22.

Structural Shapes . . .

Structural Shape Prices, Page 106

Inquiry for structurals continues to pile up in the New York market. State work is out for bidding, and a diversity of other projects is being newly figured. District fabricators, generally, are booked well ahead, some as far as seven months. Upon occasion, however, shops can work into their schedules a particularly attractive job for earlier handling.

Although awards are light and inquiry is spotty in the Philadelphia area, considerable work is reported in the active stage.

At Midwest points, such as Cleveland and Chicago, a large volume of public construction, including highway projects, is providing the structural market with a strong prop. On the West Coast, however, building projects appear to have fallen under earlier expectations. Los Angeles fabricators, nevertheless, report orders are coming in faster than they have in two years.

Generally, fabricators are more concerned over steel supplies than they are with new contracts. They are meeting increasing difficulty maintaining balanced inventories, especially wide flange beams.

That tight supply situation reflects the trend of one-story manufacturing and commercial structures which use this type structural. Some relief is expected later when an eastern mill brings in new capacity.

U. S. Steel Corp. is installing new soaking pits, a beam shear with associated transfer tables and a 9-roll straightener for beams at its Homestead Works, Munhall, Pa.

Rails, Cars . . .

Track Material Prices, Page 109

Not only is there improvement in railroad car demand, but pressure for fast equipment deliveries is mounting. Railroads are running into difficulty in getting desired deliveries because of the shortage of steel.

The New York Central Railroad,

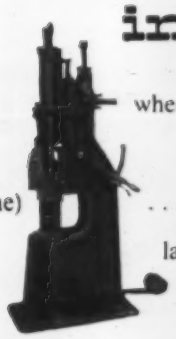
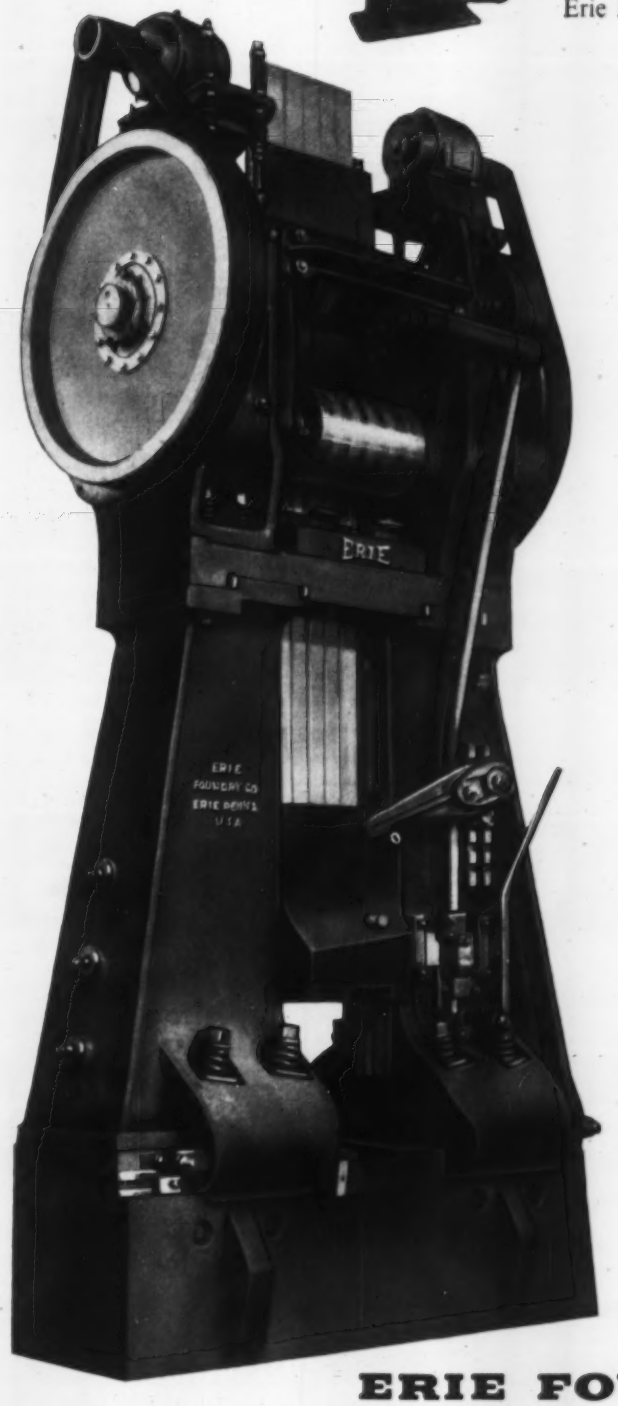
in the good old days



(such as this 100 lb. single frame)

when Erie Foundry was *the first* to use all-steel construction in all our hammers

. . . . . and when hammermen thought a board drop hammer larger than 5,000 lbs. was a wild dream . . . . even then Erie Foundry was a great name in forging hammers



today

Erie Foundry has recently built the world's largest board drop hammer. This 10,000 lb. hammer is at work for Eaton Manufacturing Co's Marion, Ohio forge plant. Eaton is forging 68 lb. net, Flat Back Ring Gears, 16" in diameter, in a single impression die, straight down without blocking or pancaking.

In addition to forging large gears speedily, Eaton likes the Erie 10,000 lb. Board Drop Hammer because the 4-roll lifting head gives longer board life. Air operated board clamps ease the hammerman's job.

As in the good old days, this 10,000 lb. board drop hammer is all-steel . . . and made by Erie.

How Pittsburgh knotted brush construction provides

- *Better Balance*
- *Uniform wear*
- *Better cleaning*
- *Longer equipment life*

Because of their construction, Pittsburgh "Lightning" knotted sections have *exactly the same number of wires in every knot.* As a result, you get a brush with perfect balance—one that will wear uniformly and cause less bearing—destroying vibration in the machine that drives it!

What's more, the special type of wire used in these knots is the fastest cutting, with the longest life, that can be produced. Built for the toughest applications, "Lightning" brushes are perfect for cleaning welds, removing scale or rubber, or cleaning parts where penetration brushing is needed.

This is just one example of superior Pittsburgh construction, engineered for both general and specific applications. For details of the complete line, write for free Catalog No. 54-W. Address: PITTSBURGH PLATE GLASS Co., *Brush Division,* Dept. O-7, 3221 Frederick Ave., Baltimore 29, Maryland.

Current Ferroalloy Quotations

MANGANESE ALLOYS

Spiegeleisen: (19-21% Mn, 1-3% Si), Carlot per gross ton $86, Palmerton, Pa.; $87 Clairton and Duquesne, Pa.
(16 to 19% Mn) $84 per ton, Palmerton, Pa.; $85 per ton, Clairton and Duquesne, Pa.

Standard Ferromanganese: (Mn 74-76%, C 7% approx.). Base price per net ton $190, Clairton, Duquesne, Johnstown and Sheridan, Pa.; Alloy, W. Va.; Ashtabula, Marietta, Philo, O.; Sheffield, Ala.; Portland, Oreg., and Tacoma, Wash. Add or subtract $2.00 for each 1% or fraction thereof of contained manganese over 76% or under 74%, respectively.

(Mn 79-81%) Lump $198 per net ton, f.o.b. Anaconda or Great Falls, Mont. Add $2.60 for each 1% above 81%; subtract $2.60 for each 1% below 76%, fractions in proportion to nearest 0.1%.

Low-Carbon Ferromanganese, Regular Grade: (Mn 85-90%). Carload, lump, bulk, max. 0.07% C, 29.95c per lb of contained Mn, carload packed 30.7c, ton lots 31.8c, less ton 33c. Delivered. Deduct 1.5c for max 0.15% C grade from above prices, 3c for max, 0.30% C, 3.5c for max 0.50% C, and 6.5c for max 75% C—max 7% Si. **Special Grade:** (Mn 90% min, C 0.07% max, P. 0.06% max). Add 2.05c to the above prices. Spot, add 0.25c.

Medium-Carbon Ferromanganese: (Mn 80-85%, C 1.5% max). Carload, lump, bulk 21.35c per lb of contained Mn, carload packed 22.1c, ton lot 23.2c, less ton 24.4c. Delivered. Spot, add 0.25c.

Manganese Metal: 2" x D (Mn 95.5% min, Fe 2% max, Si 1% max, C 0.2% max): Carload, lump, bulk, 45c per lb of metal; packed, 45.75c; ton lot 47.25c; less ton lots 49.25c. Delivered. Spot, add 2c.

Electrolytic Manganese Metal: Min carloads, 30c; 2000 lb to min carloads, 32c; 250 lb to 1999 lb 34c. Premium for hydrogen-removed metal, 0.75c per lb. Prices are f.o.b. cars, Knoxville, Tenn., freight allowed to St. Louis or to any point east of Mississippi; or f.o.b. Marietta, O., freight allowed.

Silicomanganese: (Mn 65-85%). Contract, lump, bulk 1.50% C grade, 18-20% Si, 11.00c per lb of alloy, carload packed 11.75c, ton lots 12.65c, less ton 13.65c. Freight allowed. For 2% C grade, Si 15-17%, deduct 0.2c from above prices. For 3% C grade, Si 12-14.5%, deduct 0.4c from above prices. Spot, add 0.25c.

TITANIUM ALLOYS

Ferrotitanium, Low-Carbon: (Ti 20-25%, Al 3.5% max, Si 4% max, C 0.10% max). Contract, ton lots 2" x D, $1.50 per lb of contained Ti; less ton $1.55. (Ti 38-43%, Al 8% max, Si 4% max, C 0.10% max). Ton lots $1.35, less ton $1.37, f.o.b. Niagara Falls, N. Y., freight allowed to St. Louis. Spot, add 5c.

Ferrotitanium, High-Carbon: (Ti 15-18%, C 6-8%). Contract $177 per ton, f.o.b. Niagara Falls, N. Y., freight allowed to destinations east of Mississippi river and north of Baltimore and St. Louis.

Ferrotitanium, Medium-Carbon: (Ti 17-21%, C 2-4.5%.) Contract $195 per ton, f.o.b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed.

CHROMIUM ALLOYS

High-Carbon Ferrochrome: Contract, c.l., lump, bulk 24.75c per lb of contained Cr; c.l. packed 25.65c, ton lot 26.80c, less ton 28.20c. Delivered. Spot, add 0.25c.

Low-Carbon Ferrochrome: (Cr 67-72%). Contract, carload, lump, bulk, C 0.025% max. (Simplex 34.50c per lb contained Cr, 0.03% C 36.50c, 0.04% C 35.50c, 0.06% C 34.50c, 0.10% C 34.00c, 0.15% C 33.75c, 0.20% C 33.50c, 0.50% C 33.25c, 1% C 33.00c, 1.50% C 32.85c, 2% C 32.75c. Carload packed add 1.1c, ton lot add 2.2c, less ton add 3.9c. Delivered. Spot, add 0.25c.

Foundry Ferrochrome, High-Carbon: (Cr 62-66%, C 5-7%). Contract, c.l. 8 M x D, bulk, 26.25c per lb contained Cr. Packed, c.l. 27.15c, ton 28.50c, less ton 30.25c. Delivered. Spot, add 0.25c.

Foundry Ferrochrome, Low-Carbon: (Cr 50-54%, Si 28-32%, C 1.25% max). Contract, carload, packed, 8 M x D, 18.35c per lb of alloy, ton lot 19.2c; less ton lot, 20.4c, delivered; spot, add 0.25c.

Low-Carbon Ferrochrome Silicon: (Cr 34-41%, Si 42-49%, C 0.05% max). Contract, carload, lump, 4" x down and 2" x down, bulk, 24.75c per lb of contained chromium plus 12c per pound of contained silicon; 1" x down, bulk 24.90c per pound of contained chromium plus 12.2c per pound of contained silicon. F.o.b. plant; freight allowed to destination.

Chromium Metal: (Min 97% Cr and 1% Fe). Contract, 1" x D; packed, max 0.50%, carload $1.16, ton lots $1.18; less ton $1.20. Delivered. Spot, add 5c. Prices on 0.10 per cent carbon grade, add 9c to above prices.

VANADIUM ALLOYS

Ferrovanadium: Open-hearth Grade (V 35-55%, Si 8-12% max, C 3-3.5% max). Contract, any quantity, $3.00 per lb of contained V. Delivered. Spot, add 10c. **Crucible-Special Grades** (V 50-55%, Si 2-3.5% max, C 0.5-1% max) $3.10. **Primos and High Speed Grades** (V 50-55%, Si 1.50% max, C 0.20% max) $3.20.

Grainal: Vanadium Grainal No. 1, $1 per lb; No. 6, 68c; No. 79, 50c, freight allowed.

Vanadium Oxide: Contract, less carload lots $1.28 per lb contained V_2O_5, freight allowed. Spot, add 5c.

SILICON ALLOYS

25-30% Ferrosilicon: Contract, carload, lump, bulk, 20.0c per lb of contained Si, packed 21.40c; ton lot 22.50c f.o.b. Niagara Falls, freight not exceeding St. Louis rate allowed.

50% Ferrosilicon: Contract, carload, lump, bulk, 12c per lb of contained Si, carload packed 13.6c, ton lot 15.5c, less ton 16.7c. Delivered. Spot, add 0.45c.

Low-Aluminum 50% Ferrosilicon: (Al 0.40% max). Add 1.7c to 50% ferrosilicon prices.
65% Ferrosilicon: Contract, carload, lump, bulk, 13.5c per pound contained silicon; carload packed 14.85c; ton lots, 16.05c; less ton, 17.4c, delivered. Spot, add 0.35c.

75% Ferrosilicon: Contract, carload, lump, bulk, 14.4c per lb of contained Si, carload packed 15.7c, ton lot 16.85c, less ton 18.1c. Delivered. Spot, add 0.3c.

90% Ferrosilicon: Contract, carload, lump, bulk, 17.25c per lb of contained Si, carload packed 18.45c, ton lot 19.4c, less ton 20.45c. Delivered. Spot, add 0.25c.

Silicon Metal: (Mn 97% Si and 1% max Fe). C.l. lump, bulk, regular 18.5c per lb of Si, c.l. packed 19.7c, ton lot 20.6c, less ton 21.6c. Add 0.5c for max, 0.10% calcium grade. Deduct 0.5c for max 2% Fe grade analyzing min 96% Si. Spot, add 0.25c.

Alsifer. (Approx. 20% Al, 40% Si, 40% Fe). Contract, basis f.o.b. Niagara Falls, N. Y., lump, carload, bulk, 9.25c per lb of alloy, ton lots packed 10.15c, 200 to 1999 lb 10.50c, smaller lots 11c.

ZIRCONIUM ALLOYS

12-15% Zirconium Alloy: (Zr 12-15%, Si 30-43%, Fe 40-45%, C 0.20% max). Contract, c.l. lump, bulk 8.0c per lb of alloy, c.l. packed 8.75c, ton lot 9.5c, less ton 10.35c. Delivered. Spot, add 0.25c.

35-40% Zirconium Alloy: (Zr 35-40%, Si 47-52%, Fe 8-12%, C 0.50% max). Contract, carload, lump, packed 25.25c per lb of alloy, ton lot 26c, less ton 27.25c. Freight allowed. Spot, add 0.25c.

BORON ALLOYS

Ferroboron: (B 17.50% min, Si 1.50% max, Al 0.50% max, C 0.50% max). Contract, 100 lb or more 1" x D, $1.20 per lb of alloy. Less than 100 lb $1.30. Delivered, spot add 5c. F.o.b. Washington, Pa., prices, 100 lb and over, are as follows: Grade A (10-14% B) 85c per pound; Grade B (14-18% B) $1.20; Grade C (19% min M) $1.50.

Borosil: (3 to 4% B, 40 to 45% Si). $5.25 per lb contained B, delivered to destination.

Bortam: (B 1.5%-1.9%). Ton lots, 45c per lb; smaller lots, 50c per lb.

Carbortam: (B 1 to 2%). Contract, lump, carloads 9.50c per lb f.o.b. Suspension Bridge, N. Y., freight allowed same as high-carbon ferrotitanium.

CALCIUM ALLOYS

Calcium-Manganese-Silicon: (Ca 16-20%, Mn 14-18% and Si 53-59%). Contract, carload, lump, bulk 20.0c per lb of alloy, carload packed 20.8c, ton lot 22.3c, less ton 23.3c. Delivered. Spot, add 0.25c.

Calcium-Silicon: (Ca 30-33%, Si 60-65%, Fe 1.50-3%). Contract, carload, lump, bulk 19.0c per lb of alloy, carload packed 20.2c, ton lot 22.1c, less ton 23.6c. Deld. Spot, add 0.25c.

BRIQUETTED ALLOYS

Chromium Briquets: (Weighting approx. 3¾ lb each and containing exactly 2 lb of Cr). Contract, carload, bulk, 16.05c per lb of briquet, carload packed 16.95c, ton 17.75c, less ton 18.65c. Deld. Add 0.25c for notching. Spot, add 0.25c.

Ferromanganese Briquets: (Weighing approx. 3 lb and containing exactly 2 lb on Mn). Contract, carload, bulk 11.85c per lb of briquet, c.l. packaged 12.85c, ton lot 13.65c, less ton 14.55c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicomanganese Briquets: (Weighing approx. 3½ lb and containing exactly 2 lb of Mn and approx. ½ lb of Si). Contract, c.l. bulk 12.45c per lb of briquet, c.l. packaged 13.45c, ton lot 14.25c, less ton 15.15c. Delivered. Add 0.25c for notching. Spot, add 0.25c.

Silicon Briquets: (Large size—weighing approx. 5 lb and containing exactly 2 lb of Si). Contract, carload, bulk 6.55c per lb of briquet. Packed c.l. 7.55c, ton lot 8.35c, less ton 9.25c. Delivered. Spot, add 0.25c.
(Small size—Weighing approx. 2½ lb and containing exactly 1 lb of Si). Carload, bulk 6.7c. Packaged c.l. 7.7c, ton lot 8.5c, less ton 9.4c. Delivered. Add 0.25c for notching, small size only. Spot, add 0.25c.

Molybdic-Oxide Briquets: (Containing 2½ lb of Mo each) $1.14 per pound of Mo contained, f.o.b. Langeloth, Pa.

TUNGSTEN ALLOYS

Ferrotungsten: (70-80%), 5000 lb W or more $3.80 per lb of contained W; 2000 lb W to 5000 lb W, $3.90; less than 2000 lb W, $4.02, f.o.b. Niagara Falls, N. Y.

OTHER FERROALLOYS

Ferrocolumbium: (Cb 56-60%, Si 8% max, C 0.4% max). Contract, ton lot, 2" x D, $6.90 per lb of contained Cb, less ton $6.95. Delivered. Spot, add 10c.

Ferrotantalum—Columbium: (Cb 40% approx., Ta 20% approx., and Cb plus Ta 60% min, C 0.30% max; ton lots, 2" x D, $4.65 per lb of contained Cb plus Ta, deld.; less ton lots $4.70.

Silicaz Alloy: (Si 35-40%, Ca 9-11%, Al 6-8%, Zr 3-5%, Ti 9-11%, B 0.55-0.75%). Carloads packed 1" x D, 45c per lb of alloy, ton lot 47c, less ton 49c. Delivered.

SMZ Alloy: (Si 60-65%, Mn 5.7%, Zr 5-7%, Fe 20% approx). Contract, carload, packed, ⅛" x 12 M, 17.5c per lb of alloy, ton lots 18.25c, less ton 19.5c. Deld. Spot, add 0.25c.

Graphidox No. 4: (Si 48-52%, Ca 5-7%, Ti 9-11%). C.l. packed, 17.50c per lb of alloy, ton lots 18.50c; less ton lots 20c, f.o.b. Niagara Falls, N. Y.; freight allowed to St. Louis.

V-S Foundry Alloy: (Cr 38-42%, Si 17-19%, Mn 8-11%). C.l. packed 16.6c per lb of alloy; ton lots 18.10c; less ton lots 19.35c, f.ob. Niagara Falls; freight allowed to St. Louis.

Siminal: (Approx. 20% each Si, Mn, Al; bal. Fe). Lump, carload, bulk 15.50c. Packed c.l. 16.50c, 2000 lb to c.l. 16.75c, less than 2000 lb 17.25c per lb of alloy. Delivered.

Ferrophosphorus: (23-25% based on 24% P content with unitage of $4 for each 1% of P above or below the base); carloads, f.o.b. sellers' works, Mt. Pleasant, Sigio, Tenn., $90 per gross ton.

Ferromolybdenum: (55-75%). Per lb contained Mo, in 200-lb containers, f.o.b. Langeloth, Pa., $1.46 in all sizes except powdered which is $1.57; Washington, Pa., furnace, any quantity, $1.46.

Technical Molybdic-Oxide: Per lb contained Mo, f.o.b. Langeloth, Pa., $1.25 in cans; in bags, $1.24, f.o.b. Langeloth, Pa.; Washington, Pa., $1.24.

(*Concluded from page* 116)

for instance, is inquiring for 3000 boxcars and is anxious to place orders with shipments to begin in the fourth quarter. This means considerable steel would have to be rolled in August, and that appears to be out of the question with the mills already heavily booked up for the period.

Just how this will affect ultimate buying against some of the larger railroad equipment programs under contemplation is uncertain. It is believed that the carriers eventually will go through with their purchases.

The Southern Railroad has closed on 750 hoppers to ACF Industries, New York, and 750 to the Pullman-Standard Car Mfg. Co., Chicago. The St. Louis-San Francisco is entering the market for 2000 boxcars, of which 250 may be placed with its own shops. It also is inquiring for 200 seventy-ton gondolas. The Erie has authorized the purchase of one-thousand 50-ft 6-in. box cars.

Pig Iron . . .

Pig Iron Prices, Page 111

It is difficult to gage pig iron demand with its relation to melting requirements. Buying in June proved stronger than anticipated, but the degree to which an expected price advance is spurring demand can't be determined.

Movement of merchant iron this week will reach a low ebb because of mass vacations at a number of foundries. Many other foundries will be down for vacations later in the summer.

Ferroalloys . . .

Ferroalloy Prices, Page 119

Reductions of $5.10 and $1.60 respectively in prices for ferrocolumbium and ferrotantalum-columbium were made effective July 1 by Electro Metallurgical Co. division of Union Carbide & Carbon Corp., New York. The new base price for ferrocolumbium is $6.90 a pound of contained columbium; for ferrotantalum-columbium $4.65 per pound of contained columbium, plus tantalum.

Recent completion of the government stockpiling program for columbium-tantalum ores and withdrawal of the 100 per cent bonus which had applied to the ore to stimulate production, have resulted in substantially lower ore cost and make possible the reduction in columbium alloy prices.

Domestic mine shipments of manganese ore in March, totaling 23,200 tons, were off 20 per cent from shipments in February.

Imports of ore containing 35 per cent or more manganese totaled 111,839 tons in the month, a decrease of 25 per cent from February.

Production of manganese alloys (ferromanganese, silicomanganese, and manganese metal) increased 22 per cent in the month to 82,671 short tons.

Iron Ore . . .

Iron Ore Prices, Page 121

Shipments of Lake Superior iron ore in the week ended June 27 totaled 2,963,850 gross tons, reports the Lake Superior Iron Ore Association. This was the second largest weekly tonnage moved to date this year. The season's movement to June 27 was reported at 26,366,488 tons, nearly 6 million tons more than the figure up to June 27 in the 1954 navigation season.

Metallurgical Coke . . .

Metallurgical Coke Prices, Page 121

Foundry coke demand holds fairly steady and isn't feeling the speculative play characterizing pig iron currently. For one thing, coke is bulky and discourages inventory build-up.

ELECTRIC FURNACE
STEEL CASTINGS
ARE FOUNDRY ENGINEERED

Regardless of the type of product you make — if you are interested in strength, toughness, uniform structure, resistance to fatigue, long life, lower machining and lower assembly costs — you'll be interested in C Steel Castings. The point is that they are sound, clean, true to pattern castings that by alloy and heat treating possess an almost unlimited range of mechanical properties.

Why Not Investigate?

Perhaps by cooperating with your engineers in details of design and pattern construction we may be able to save you both machining and assembling costs.

IF METALWORKING PLANTS ARE YOUR PROSPECTS . . .

STEEL can put you in touch with the important ones, those that do more than 92% of the industry's business. Tell the buyers and specifiers in these plants of the machines or materials you have for sale through an "Equipment—Materials" advertisement. For rates write STEEL, Penton Building, Cleveland 13, Ohio.

Scrap . . .

Scrap Prices, Page 134

Philadelphia—Steel scrap prices advanced again, with a greater number of grades affected. Strength is due mainly to high consumption at the mills, combined with a continued lag in incoming shipments at dealers' yards. Collections have been so slow that some dealers have closed down for a week to two weeks for mass vacations.

In addition to some recent mill purchases of prime grades of open hearth scrap at $39, delivered, the Fairless, Pa., consumer is negotiating for additional tonnage. Meanwhile, sellers are having to pay more in covering on some of this consumer's purchase last month. Also, while the pressure for steel scrap for export is easing, brokers are having difficulty supplying tonnage against commitments.

Chicago—Purchases of scrap by two leading mills here have lifted prices on steelmaking grades of scrap $1 a ton. This puts No. 1 industrial heavy melting at $36 and No. 1 dealer at $34, with No. 1 factory bundles at $37. Turnings and borings are up $2 on purchases just outside the immediate Chicago consuming area.

Cleveland—Despite the uncertainties arising from the steel labor negotiations, the scrap market here and in the Valley is displaying a decidedly strong tone with dealer prices up $2 to $3 per ton. Production scrap is reportedly quoted $2 higher. The strength reflects sales both here and in the Valley. At the latter point No. 1 steel sold at $38, purchases being made by two of the leading mills.

Buffalo — Increased quantities of scrap are moving out of the area as local prices fail to keep pace with those quoted in other districts. Mills report large yard stocks and fresh inquiries are restricted. Shipments from the area to Canada and the Valley are noted.

New York—Scrap brokers have advanced buying prices sharply on several major grades. Heavy consumption here buttressed by continued demand from abroad is the underlying factor for strength. Brokers are offering $34-$35 for No. 1 heavy melting and No. 1 bundles; $30-$31 for No. 2 heavy melting; and $23-$24 for No. 2 bundles.

They also have advanced offerings for machine shop turnings to $15-$16; for mixed borings and short turnings to $16-$17. They are buying low phos structural and plate at $36-$37. In the cast grades they are paying higher for breakable cast at $34-$35.

In stainless steel scrap brokers' buying prices are up $5 on 18-8 borings and turnings which are holding at $110-$115. Other stainless grades are unchanged.

Boston — Steel scrap prices are higher on heavier grades with new buying by eastern Pennsylvania and district consumers. Included are No. 2 bundles, which are in better supply with most yards. Buying for export has slumped.

Pittsburgh—Heavy melting grades of scrap are quoted at $1 a ton higher on the basis of brokers' buying prices. It is difficult to buy good No. 1 heavy melting scrap at $35, and $36 is being paid. There are free predictions that a higher price will be paid by mills if they re-enter the market in volume now.

Birmingham — Prices are unchanged, but the scrap market here looks a little stronger because of higher prices in the North.

Youngstown—Republic Steel Corp. and Youngstown Sheet & Tube Co. are reported to have made small purchases of No. 1 heavy melting steel at $38 a ton, $3 above the recognized market of $35 here. The sales served to strengthen the market at Cleveland. Purchases of some No. 2 heavy melting at about $32 and No. 2 bundles at $26 are reported to have been made here by U. S. Steel Corp. Also, Copperweld Steel Co., Warren, O., bought a tonnage of No. 1 heavy melting. Local mills, for the most part, have been buying scrap direct from manufacturing plants and have been using a larger proportion of hot metal in their furnace charges.

Cincinnati—A stronger tone prevails in the local scrap market. Quotations on No. 2 heavy melting are up $1 a ton to $27-$28, while No. 2

(*Please turn to page* 126)

"BEST $1286 WE EVER SPENT!"

That's the price of this 5-Ton HANNIFIN Press*

A lot of production men have made such comments about this versatile little hydraulic press.

They like the way you can adjust it to the exact force you need for each job, all the way from 1 ton to 5 tons. The backstroke is adjustable, too, so the ram just clears the work on any job. Fast-acting controls. Prompt delivery from stock.

WRITE. Complete information and prices on the Hannifin line of 1- to 10-ton Hydraulic Presses will be sent on request.

*Price complete with motor and starter F.O.B. our press plant, St. Marys, Ohio, subject to change without notice.

For increased d-c power . . .

N. W. Ceist, Rectifier Department Sales Manager, presents one of the new, sealed Ignitron rectifiers, now available in greatly extended ranges. It is the same type used in this metal-enclosed rectifier unit, rated at 1500 kw, 250 volts, for steel mill service.

NOW! GET WESTINGHOUSE SEALED IGNITRONS IN HIGHER RATINGS, COMPLETELY ENCLOSED UNITS

You can now get d-c power conversion for *any* application with the new, higher rated Westinghouse sealed Ignitron rectifiers. These Ignitrons, through the entire load range, have a clear-cut efficiency advantage over other forms of conversion equipment.

Westinghouse sealed Ignitrons are basically simple . . . there are no major moving parts; all vacuum connections and indicating equipment have been eliminated. Here is a big bonus in less maintenance, lower operating cost. Tubes are permanently sealed at the factory; replacements can be obtained without delay from stock, insuring a minimum of outage time. Ignitron cubicles are completely preassembled and wired—ready for installation upon delivery.

As a Westinghouse unit substation—with associated dry-type or liquid-filled transformers and a-c and d-c switchgear—the new Ignitron rectifiers are more compact, *require less floor space per kw,* than any other conversion equipment. And, with the grounded, dead-front metal enclosure, all personnel hazards are eliminated.

For further data, call your Westinghouse sales engineer, or write to Westinghouse Electric Corporation, Box 868, 3 Gateway Center, Pittsburgh 30, Pa.

for military production . . .

Whatever your heat process problems in plant conversion for military production, CONTINENTAL has the answer.

CONTINENTAL jobs begin with analysis of the requirements, then the selection and development of proper methods for greatest results. Finally follows the design, the building, and installation of the equipment including necessary work-handling accessories and control devices—delivering a COMPLETE UNITIZED PRODUCING PACKAGE with results guaranteed.

The broad experience of CONTINENTAL offers you a prompt, sure solution to your change-over program.

PEARLITIC MALLEABLE CASTINGS

The 2-speed truck axle is a *must* under varying load and road conditions because it provides a tailor-made ratio for every condition. But it takes a severe beating under heavy duty conditions encountered in logging, mining, farming, etc.

That's why Eaton Manufacturing Company, leading producer of 2-speed axles, specifies pearlitic malleable — from National — for several vital parts. For Eaton knows that pearlitic malleable has high ultimate strength . . . resists wear under heavy loads at high speeds . . . possesses excellent non-seizing properties. In addition, pearlitic malleable can be given a smooth finish . . . can be either liquid or air quenched. And perhaps *most important of all, pearlitic malleable machinability index ranges from 80 to 90* (B1112 steel = 100).

Look your product over critically. Pearlitic malleable castings—from National—can replace costlier fabrication methods . . . can offer opportunities of reduction in weight, machining and assembly time. AA-1197

PANGBORN BLASTS
by doc herold

COST-CUTTING STORY OF THE PANGBORN BLAST CLEANING MACHINE

Pangborn Blast Cleaning Machine—available in six types, stationary or portable—delivers efficient, low cost maintenance in any plant. $188 up.

For details, write: PANGBORN CORP., 1600 Pangborn Blvd., Hagerstown, Maryland.

FALLACIES AND FACTS FOR CARBIDE BUYERS

Specifying "or equivalent" carbide on tool prints forces toolmakers to use cheapest grade

Blunt — but needed — this clarification by the manufacturer of Carboloy Cemented Carbide shows how the practice of designating "equivalent" grades works against the user of carbide tools.

Placing the phrase "or equivalent" on a tool print used to obtain competitive toolmakers' bids, does this:

It forces each toolmaker to quote on the basis of using the *cheapest* carbide — not necessarily the *best* carbide for your job.

The reason is obvious: To be competitive these days means submitting the lowest bid. Justifiably, your toolmakers try to keep their costs low. Consequently, they will use the cheapest available carbide, *if you give them a written mandate practically ordering them to do so.*

And you *do* give competing toolmakers this written mandate to buy the cheapest carbide, by giving them the option of selecting a so-called "equivalent" grade. By this practice, you *force* each toolmaker to protect himself *by also looking for the cheapest available grade. As a result, the purchase is not made in terms of your production ability. It's made solely on price.*

At the bottom of this kind of purchasing is the increasing promotion by some carbide manufacturers of the so-called "industry standard" or "equivalent" charts.

There are no "equivalent" charts

It should be recognized that no true industry standard or equivalent charts exist. Charts which show various manufacturers' grades of carbide, and suggest the types of machining operations for these grades, are "recommendation" charts. They were originally intended for use only to show the *types of machining* a certain group of grades would do. *They were never intended to be used to show that the grades of carbide within a certain category would perform equally well and, consequently, could be used interchangeably.*

However, some carbide manufacturers have sought to benefit themselves by having their grades thought of as being "equivalent" to certain other carbides on the market. This attempt to sell by "association" is the real reason behind the emphasis on getting carbide users to accept the so-called "equivalent" method.

"Carboloy" cannot be used to mean any brand of carbide

Hand-in-hand with this type of carbide selling is the increasing word-of-mouth use of the registered Carboloy name to mean *any* brand of carbide. The name "Carboloy" is the registered trademark of the Carboloy Department of General Electric Company. As such, it is the brand name of our products alone. Strict insistence on the proper use of this name is our way of protecting both our customers and ourselves.

In many instances, carbide users have complained to us that they have purchased tools with "Carboloy" which did not perform to their expectation or past experience. Investigations showed that they had really purchased another manufacturer's carbides, but had been assured they had received "Carboloy."

Such free use of our name, we suspect, is a Penalty of Leadership.

Your only real test — *production ability*

We offer this suggestion — when you buy or use carbides, find out for yourself which carbide will give you the *most production.* If you care to, ask a Carboloy sales engineer to help you run the tests — but *you* set them up, in *your* own shop. Then compute your carbide cost based on *production ability.*

We have hundreds of in-plant case histories proving what our grades will do under any operating conditions. They show you how you get more for your carbide dollars when you specify *Carboloy* cemented carbides from your distributor or toolmaker. Write, or call, for assistance in getting the most out of your tooling dollars.

"Carboloy" is the trademark for products of the Carboloy Department of General Electric Company

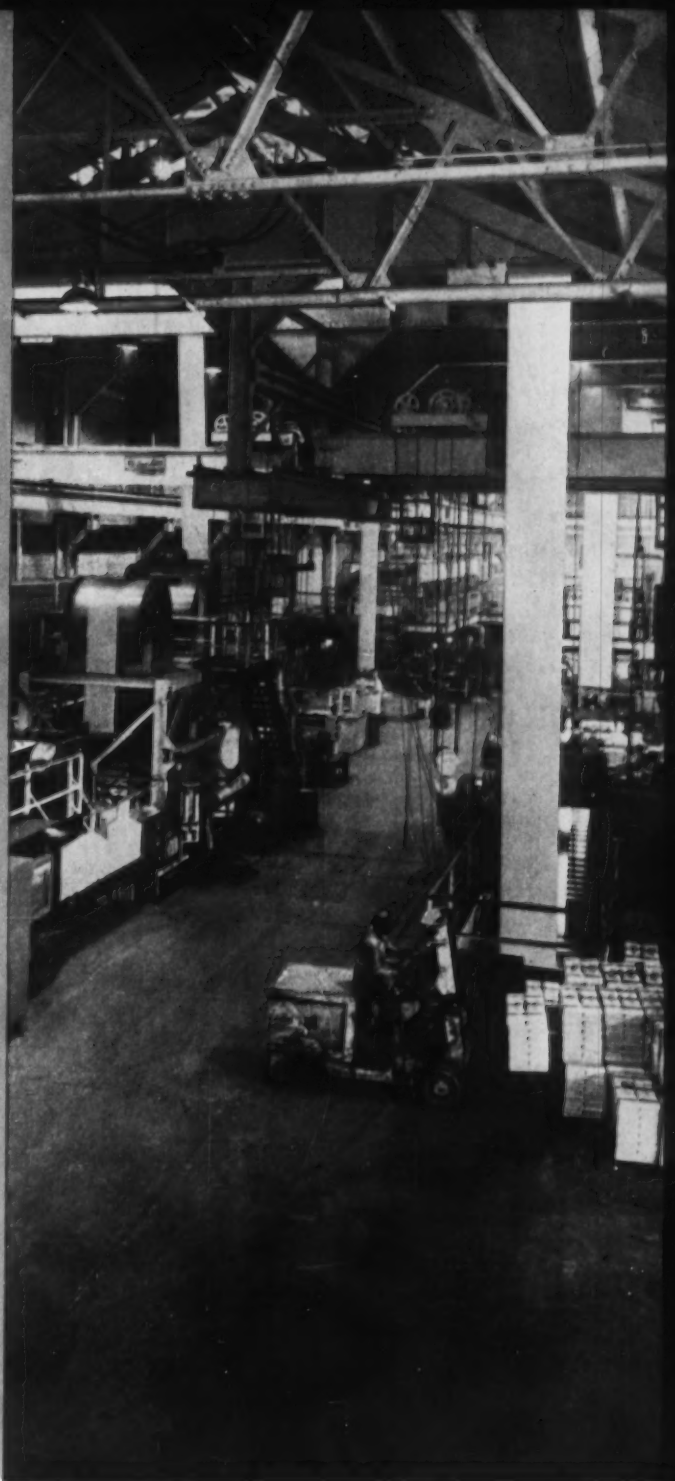
CONTINUOUS GALVANIZING LINES BUILT BY AETNA



● **The 25th Aetna-built Continuous Galvanizing Line could be yours.** If you are considering a Continuous Galvanizing Line, you probably have ideas about the most practical process for your production. The lines offered by Aetna-Standard include all of the different processes and types in use today. This ability to combine specialized knowledge of Continuous Galvanizing with your own specific ideas is a principal reason for Aetna's building more lines than all other manufacturers. Add the most important requirement of all—performance of the equipment, plus integrity and ability to work with people, and you have some of the reasons why more companies select Aetna-Standard than any other manufacturer to build their Continuous Galvanizing Lines.

Will the 25th be yours?

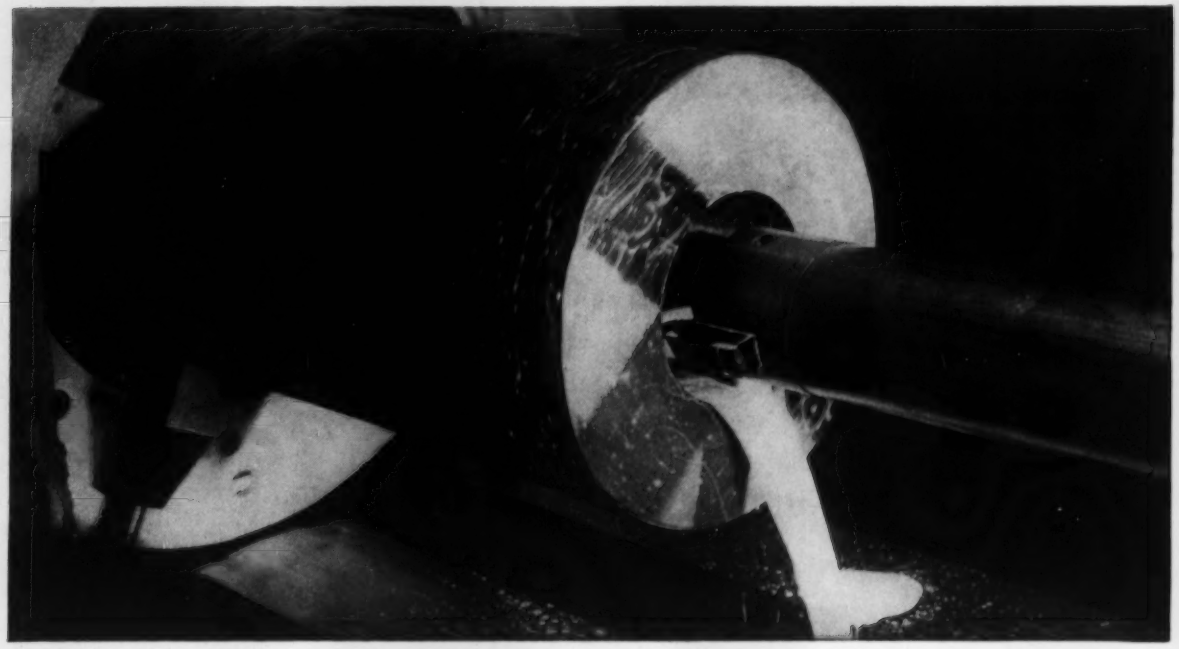
START WITH FINISH BORING!



TIMKEN® seamless steel tubing saves steel, machining time!

FINISH boring is your first production step when you use Timken® seamless steel tubing instead of bar stock for your hollow parts jobs. You don't have to bore out the center hole. With Timken seamless tubing, it's "built-in"! So screw machine stations are available for other jobs. You add machining capacity without adding machines.

Because the center hole is already there, you also save steel with Timken seamless tubing. There's far less metal to machine away, giving you more parts per ton of steel.

To save you even *more* steel, the Timken Company's engineers will study your problem and recommend the most economical tube size for your hollow parts job—a size guaranteed to clean up to your dimensions.

Timken seamless tubing results in a better quality product, too. The piercing operation by which Timken tubing is made is basically a forging operation. This gives the tubing a uniform spiral grain flow and a refined grain structure that brings out the best in the quality of the metal. And this quality is uniform from tube to tube and heat to heat, due to the Timken Company's rigid quality control. The Timken Roller Bearing Company, Steel and Tube Division, Canton 6, Ohio. Cable address: "TIMROSCO".
